

Supplemental Figure S1. Effects of blue light (BL) irradiation on the localization of phot1 proteins. Dark-grown *phot1* transgenic plants harboring *35S::PHOT1-GFP* were irradiated with continuous BL at $0.2 \mu\text{mol m}^{-2} \text{s}^{-1}$. Green fluorescent protein signals were observed with a microscope at the indicated time after the onset of BL irradiation. White bar, 50 μm .

Supplemental Methods

Cloning of 35S::PHOT1-GFP

For construction of 35S::PHOT1-GFP, the coding region of *PHOT1* amplified using PCR was inserted in frame at the *Bam*HI site upstream of GFP in the pTH2 vector (Niwa, 2003). The vector digested with *Hind*III and *Eco*RI was subcloned into the binary vector pPZP211 (Hajdukiewicz et al., 1994). The constructs were transformed into the *phot1-101* mutant (*Landsberg erecta* background) via the floral dipping *Agrobacterium tumefaciens*-mediated transformation method as described previously (Clough and Bent, 1998).
