

Additional File 6

Additional file 6. A pool of I κ B α co-localizes with RNF121

(A) HeLa cells were treated or not with TNF α (10 ng/ml) for 15 min in the absence or the presence of the proteasome inhibitor MG132 (10 μ M), then the localization of RNF121 and I κ B α were investigated by immuno-fluorescence. Nuclei were stained with DAPI. Representative images are shown, with the boxed areas enlarged on the right.
