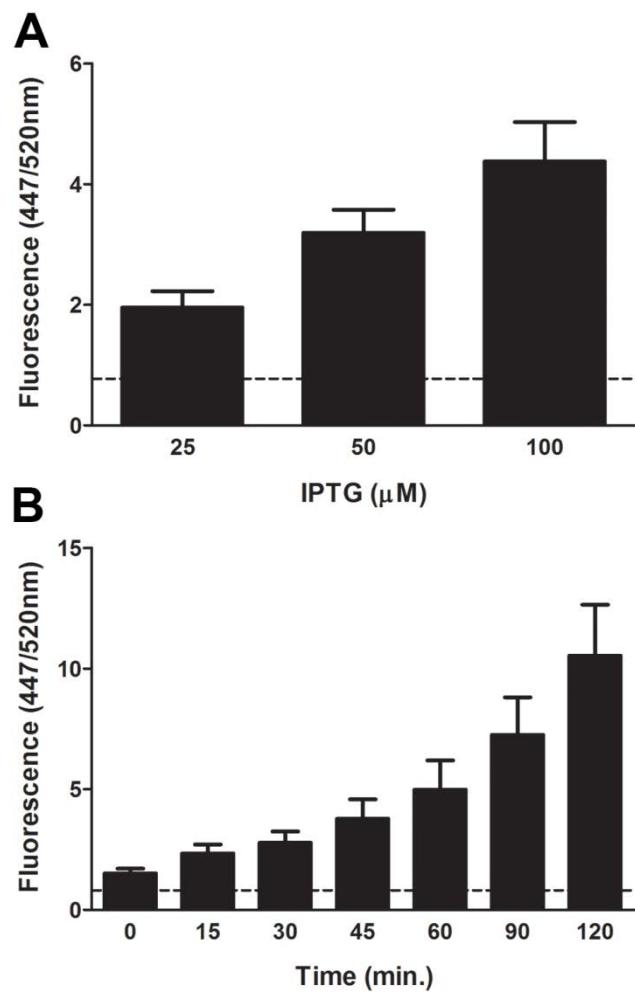

Figure S1: Release of YbcL_{UTI} from the periplasm is dose- and time-dependent.

Experiments were conducted and data are represented as described for Fig. 4. During infection of 5637 cells, the level of β -lactamase activity in the supernatant positively correlated with the level of IPTG induction (A) and the duration of infection (B).

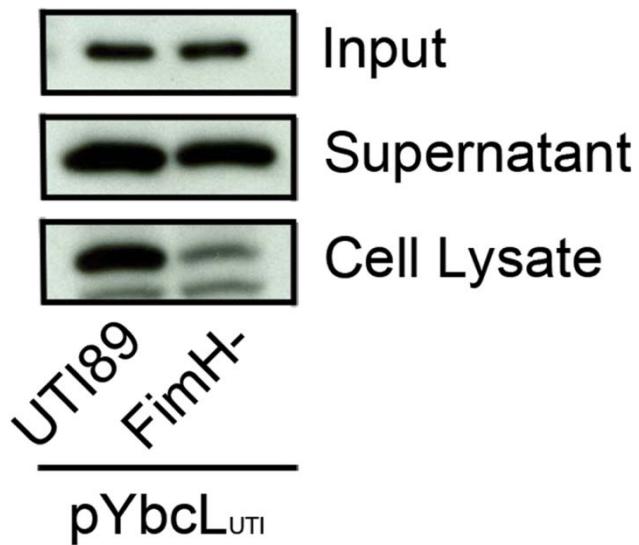

Figure S2: Type 1 pili augment release of YbcL_{UTI} from the periplasm. Experiments were conducted and data are presented as described for Fig. 3. Compared to infection with UTI89/pYbcL_{UTI}, less YbcL_{UTI} was detected in the supernatant and 5637 cell lysate when a type 1 pilus mutant (UTI89/pYbcL_{UTI}*fimH::kan*) was used as the bacterial inoculum.
