

SUPPLEMENTARY MATERIALS AND METHODS

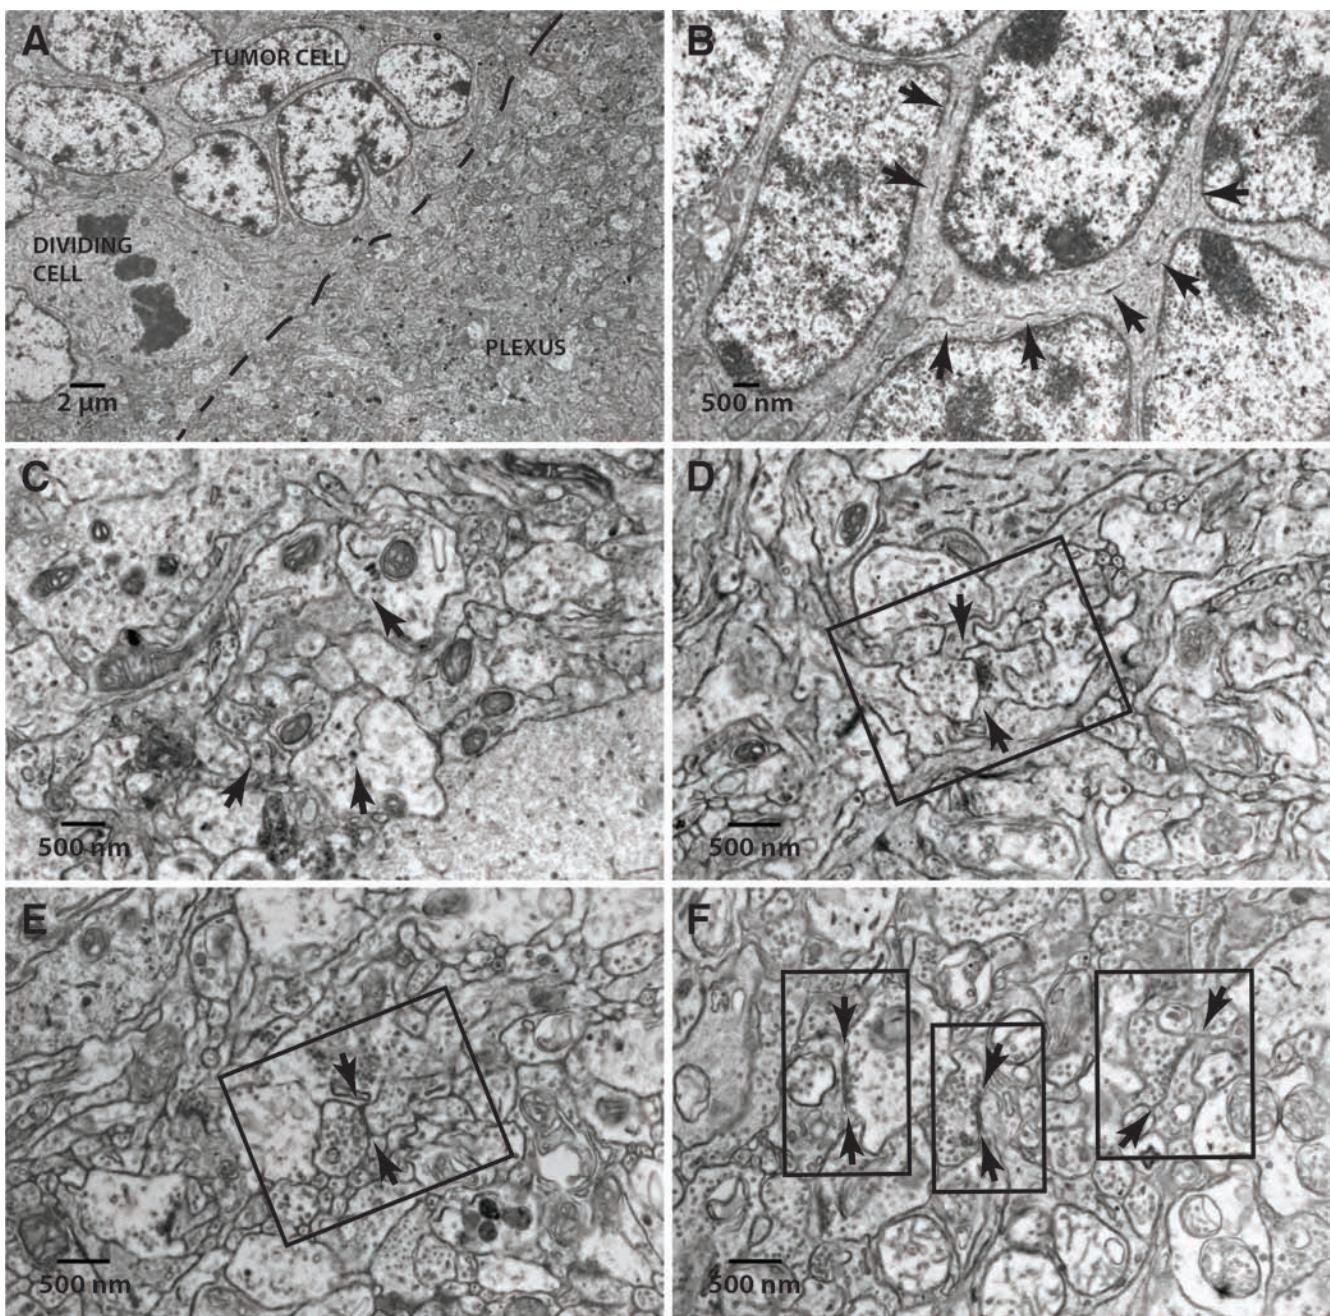

Transmission electron microscopy

All procedures for TEM have been described previously (Johnson et al. 2006). Animals were anesthetized with Avertin until a loss of deep tendon reflexes. Transcardial perfusion was performed with carboxygenated Ames Medium supplemented with

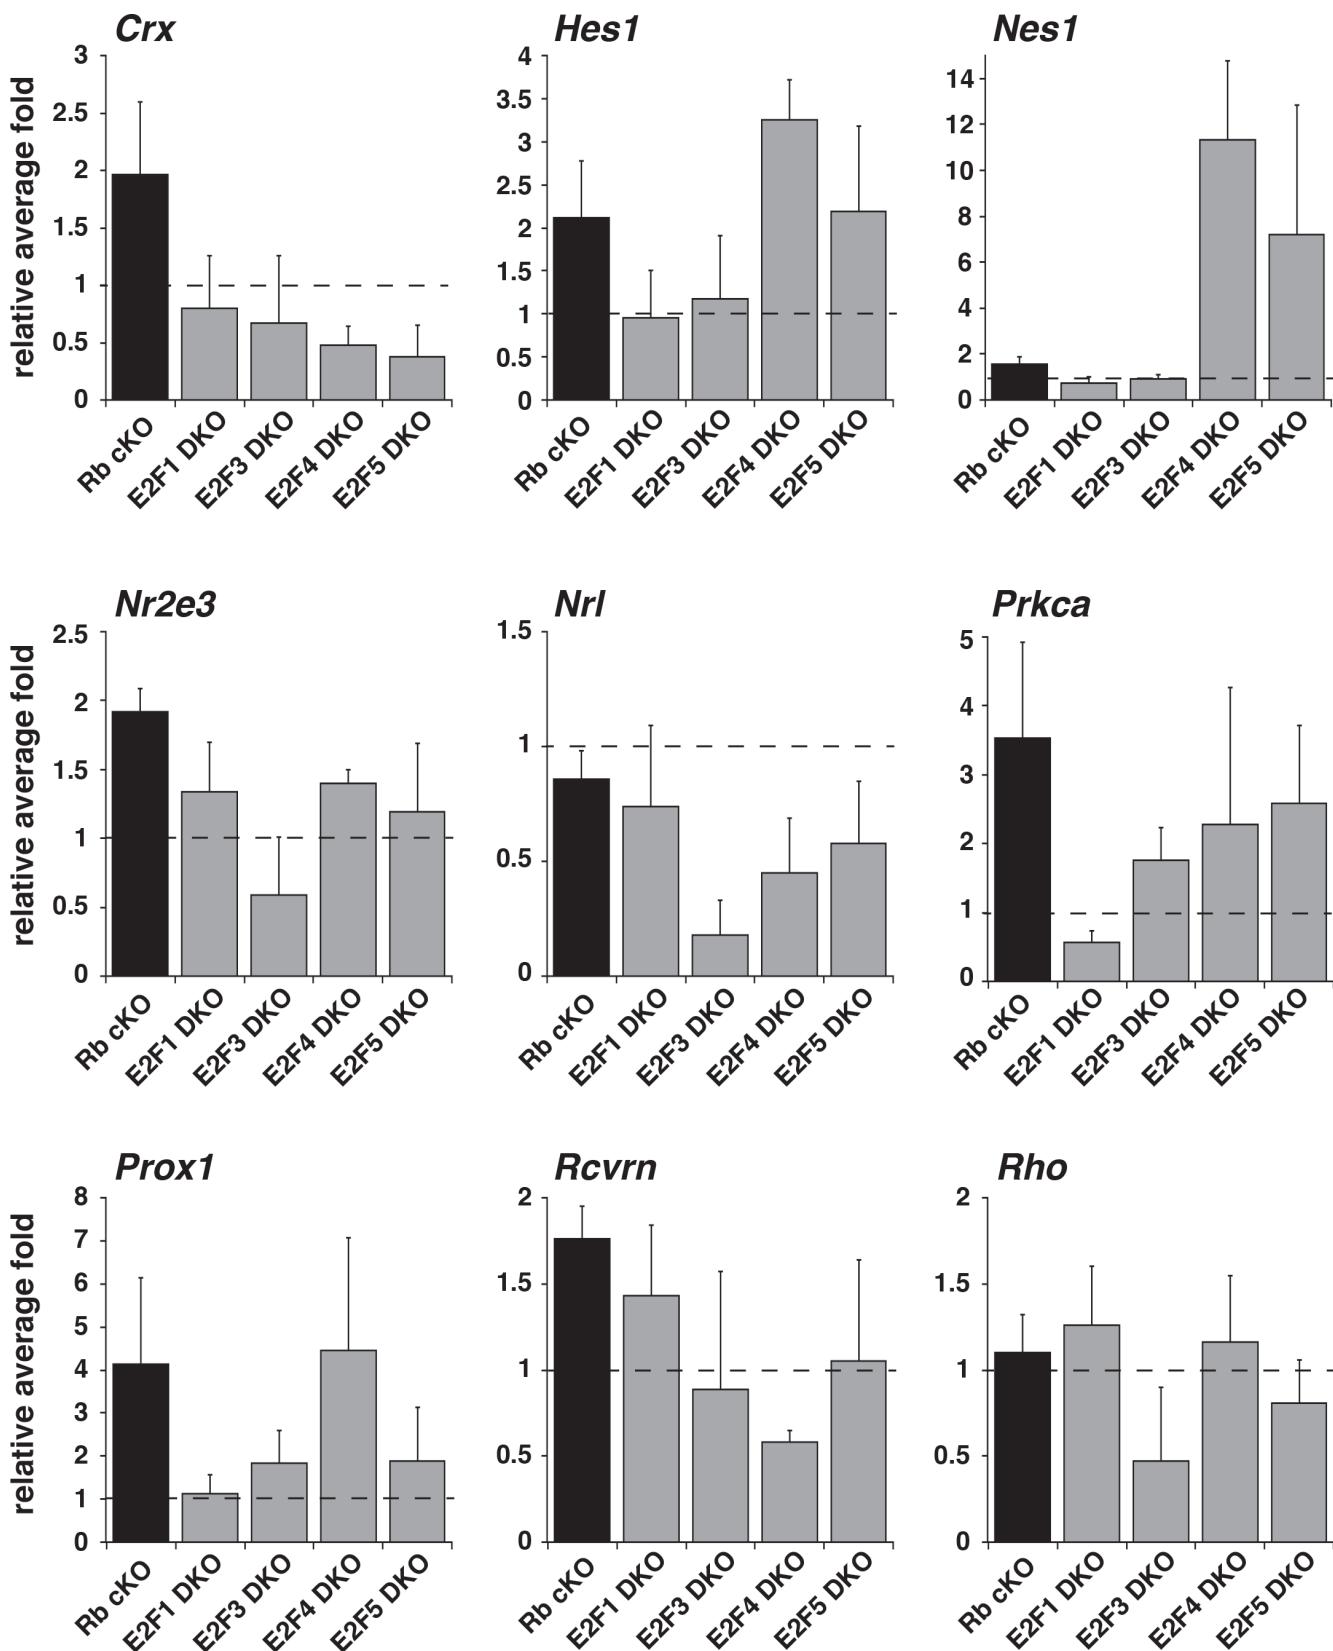

40 mM glucose to clear the vasculature, followed by perfusion with Sorenson's phosphate buffer pH 7.2 with 2% EM grade paraformaldehyde and 1% EM grade glutaraldehyde. Eyes were then harvested, a slit was made in the cornea to aid in diffusion, and the tissue was placed in 3% glutaraldehyde in Sorenson's phosphate buffer overnight. Tissue was washed with 0.2 M cacodylate buffer in 5% sucrose, post-fixed in 1% OsO₄, embedded, sectioned, and viewed by transmission electron microscopy (TEM).

Supplementary Figure S1: Transmission Electron Microscopy from E2f5 TKO Tumors. (A-E) Transmission electron microscopy (TEM) from a *Chx10-Cre; Rb^{lox/lox}; p107^{-/-}; E2f5^{lox/lox}* (E2f5 TKO) tumor show that these tumors have all of the differentiation features of 7D and human retinoblastomas with (A) dividing cells, tightly packed tumor cells with areas of plexus, (B) cell to cell junctions among the tumor cell soma (arrows), (C) dense core vesicles (arrows), (D-E) and processes and synapses (box). The synapses seen in E2f5 TKO tumors are amacrine-like synapses. (F) TEM of amacrine synapses (boxes) at the inner plexiform layer from a *Chx10-Cre; Rb^{lox/lox}; E2f5^{lox/lox}* (E2f5 DKO) retina shown as comparison of the amacrine-like synapses seen in retinoblastoma tumors.

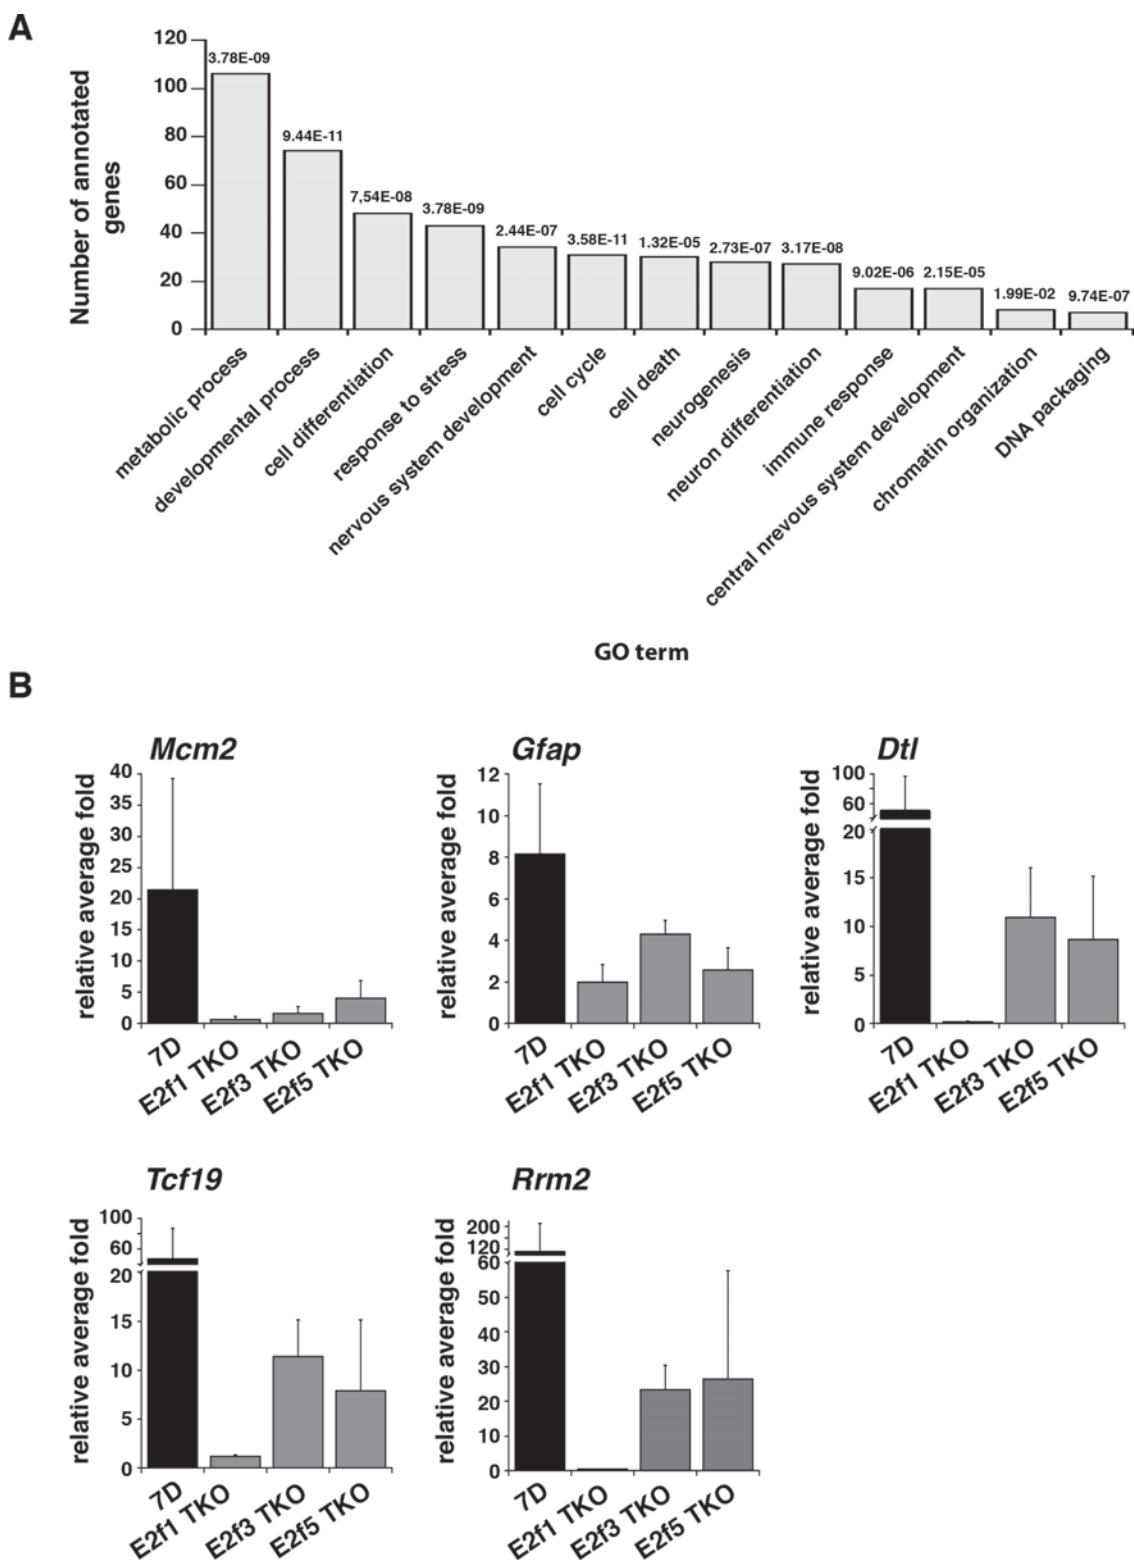

Supplementary Figure S2: Real Time RT-PCR Analysis of Retinal Development Genes. Real time RT-PCR analyses for P21 retinas from E2f DKO mice for various retinal development genes. Relative average fold was calculated compared to wt. Each bar is the mean and standard deviation of 5 biological replicates ran in duplicate.

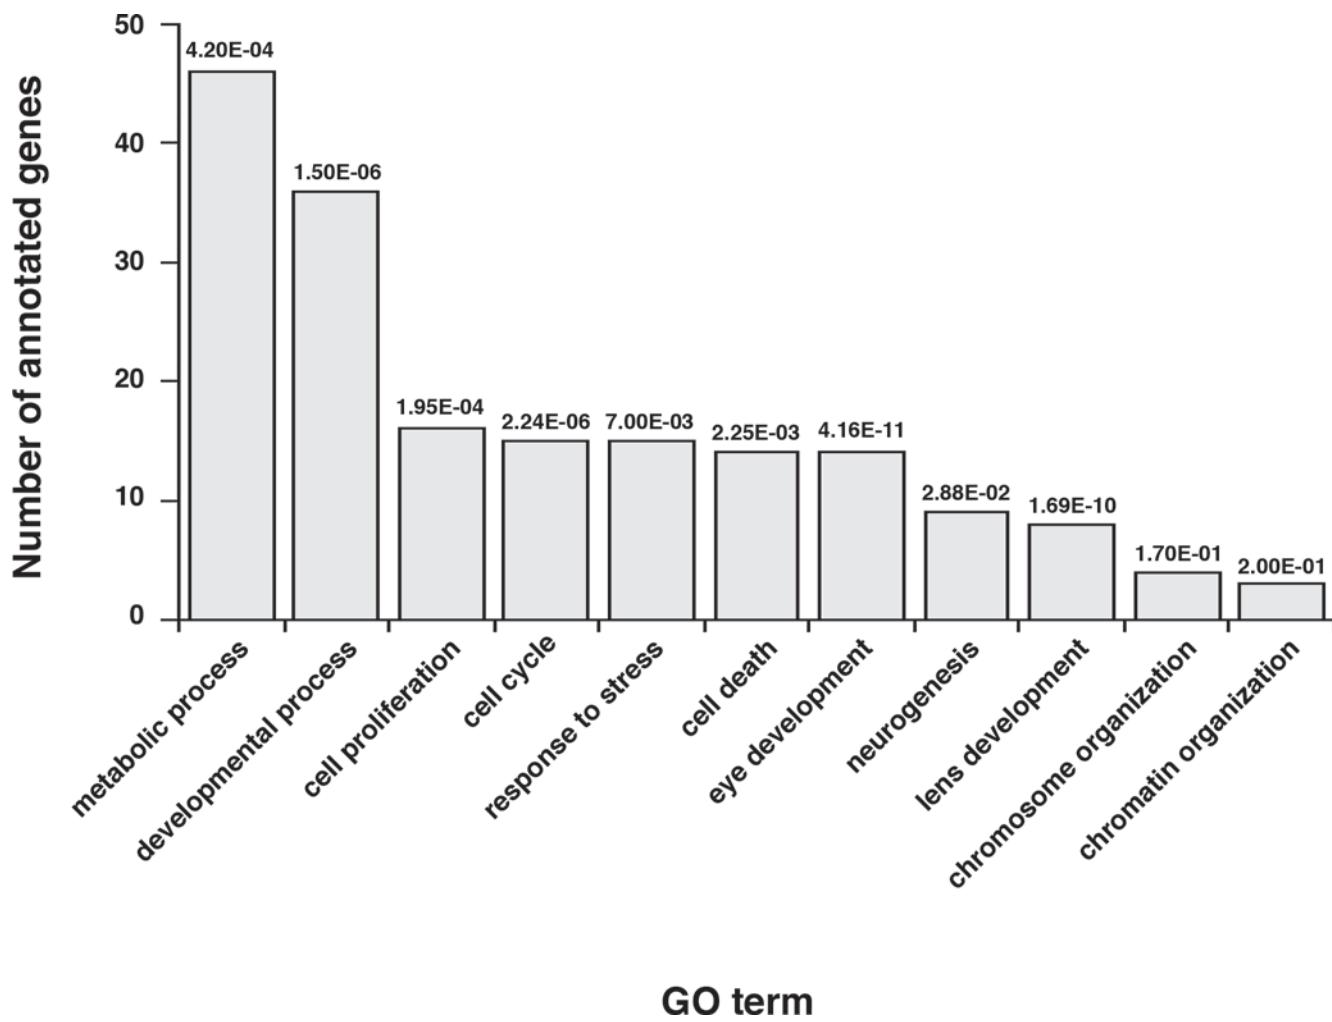

Supplementary Figure S3: Transmission Electron Microscopy from E2f DKO Retinae. (A-F) Transmission electron microscopy (TEM) from P21 E2f DKO retinas. (A-B) *Chx10-Cre;Rb^{lox/lox};E2f1^{-/-}* (E2f1 DKO) retinas show normal thickness of (A) the outer nuclear layer (ONL) and (B) outer plexiform layer (OPL) with some evidence of persistent progenitors (asterisk). (C-D) *Chx10-Cre;Rb^{lox/lox};E2f3^{lox/lox}* (E2f3 DKO) retinas show thinning of (C) the ONL and (D) OPL. (E-F) *Chx10-Cre;Rb^{lox/lox};E2f5^{lox/lox}* (E2f5 DKO) retinas also show thinning of the (E) ONL and (F) OPL. INL: inner nuclear layer.

Supplementary Figure S4: Transmission Electron Microscopy Showing Persistent Progenitor Cells in E2f TKO Retinae. TEM analysis of E2f TKO retinae show (A) The “length” of unusual cells with pale nuclei termed “persistent progenitors” varies from the average diameter of normal rods to more than twice as large. Also, their chromatin is less condensed than normal rods. (B) The differences in the size and shape of these cells may reflect two stages. Stage 1 cells are approximately the size of normal rods but with some nuclear invagination. Their chromatin is more dispersed and some present nucleoli. Stage 2 cells are large in size, often elongated. Their nucleus is highly pleomorphic, with no evidence of chromatin condensation. No nucleoli are present but small dark circular inclusion bodies are often seen within the pale nucleus. Clumps of persistent progenitors in both stages are usually found on the proximal edge of the OPL within the ONL. (C) Both cell stages (stage2) and normal rods (R) can be displaced into the outer plexiform layer (OPL). Displaced rod somata are often elongated. (D) Example of stage 1 and stage 2 cell. Inset: Stage 2 cell could be traced, showing process projecting into OPL in close apposition to neighboring rod spherule. (E) Two stage 1 cells are shown, one appears to contain spherule elements: synaptic ribbon and junction with two horizontal cells.

Supplementary Figure S5: Real Time RT-PCR Validation of Putative Rb-Target Genes Involved in Retinal Development. (A) Histogram from the Gene Ontology (GO) analysis of the 322 genes that are putative Rb-targets involved in retinal development. Each bar is the number of annotated genes from a subset of the GO terms found. Numbers above the bars depict the respective P-values. (B) Real time RT-PCR validation of a subset of genes involved in retinal development show a significant increase in gene expression in the *Chx10-Cre;Rb^{lox/lox};p107^{-/-}* (7D), *Chx10-Cre;Rb^{lox/lox};p107^{-/-};E2f3^{lox/lox}* (E2f3 TKO) and *Chx10-Cre;Rb^{lox/lox};p107^{-/-};E2f5^{lox/lox}* (E2f5 TKO) mouse strains that display retinal development defects but not in *Chx10-Cre;Rb^{lox/lox};p107^{-/-};E2f1^{-/-}* (E2f1 TKO) which rescue the developmental defects. Each bar is the mean and standard deviation of 5 biological replicates ran in duplicate.

Supplementary Figure S6: Gene Ontology Analysis of Putative Rb-Target Genes Involved in Retinoblastoma. Histogram from the Gene Ontology (GO) analysis of the 148 genes that are putative Rb-targets involved in retinal tumorigenesis. Each bar is the number of annotated genes from a subset of the GO terms found. Numbers above the bars depict the respective P-values.
