

SUPPLEMENTARY FIGURES AND TABLES

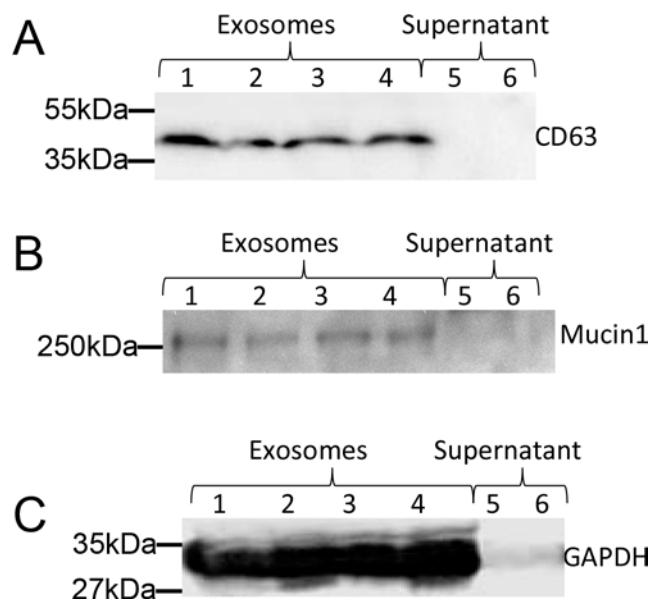

Supplementary Figure S1: Decreased serum levels of cell-free miR-101 are associated with lymph node metastasis. The box plot compares the serum concentrations of miR-101 in lymph node-negative (n=114) with those in lymph node-positive patients (n=53). As determined by the Mann-Whitney-U test, the significant p-values of the statistical evaluations are indicated.

Supplementary Figure S2: miR-373 does not affect cell proliferation. MCF-7 and MDA-MB-231 cells were transiently transfected with empty expression plasmid or plasmid encoding for miR-373, with mimics or inhibitors of miR-373, and treated with MTT. Cell proliferation after overexpression and inhibition of miR-373 for 24, 48 and 72 hours. The standard deviations from triplicate experiments are indicated.

Supplementary Figure S3: miR-101 does not affect cell migration and invasion of breast cancer cells. Cell migration and invasion of MCF-7 and MDA-MB-231 cells were analyzed by transwell assays. Cells were transfected with mimics or inhibitors of miR-101 prior to serum starvation for 24 hours. Cells were added to the upper transwell chamber that was uncoated for the migration assay and BME-coated for the invasion assay, and allowed to migrate or invade for 24 hours. Migrated or invaded cells were stained with Calcein-AM, and fluorescence was measured at excitation of 485nm and emission of 535nm.

Supplementary Figure S4: Extraction of serum exosomes. Exosomes were extracted and pelleted from serum and analyzed by Western blot using an antibody specific for the proteins (A) CD63, (B) Mucin1 and (C) GAPDH. As a negative control served the supernatant of the pellet that displayed no exosomes when the antibodies against CD63, Mucin1 and GAPDH were added. The Western blot shows representative examples of the exosome extraction from pellets of four breast cancer patients (lane 1, 2, 3, 4) and the negative control of two patients (lane 5, 6).

Supplementary Table S1. Patient characteristics at the time of primary diagnosis of breast cancer and correlation to the relative miR concentrations in serum.
