

- Prosthetic vascular graft infection (PVGI) is a severe complication of vascular surgery that carries high morbidity and mortality rates.
- Here, we report the experience of a referral center for the management of PVGI, especially during the crucial post-operative period with high doses of daptomycin (DAP).
- Our findings indicate that high doses of DAP are well tolerated in patients with a severe condition and with moderate or severe renal impairment.
- We can conclude that DAP is a good alternative to vancomycin.
- It's the first report in the literature concerning these patients.
