

Figure S3. Impact of acetosyringone in the infiltration medium on HA-HFBI accumulation.

Following agroinfiltration with the H1-HFBI construct in the presence (+) or absence (-) of acetosyringone in the infiltration medium, total soluble proteins (TSP) were extracted at 6 dpi and the band corresponding to H1-HFBI was quantified by Western blotting. (n=16, bars = SD, p-value = 0.0011).
