

**Supplemental Figure and Tables for:**

SS Kharade and MJ McBride. "*Flavobacterium johnsoniae* PorV is required for secretion of a subset of proteins targeted to the type IX secretion system"

Table S1. Primers used in this study

Primers	Sequence and Description
737	5'-AGGCACCCCAGGCTTTACACT-3'; Reverse primer binding downstream of multiple cloning site of pLYL03.
948	5' - GCTAGGGATCCTCTTGCAGGCTCAACTACCGGAAT - 3'; Forward primer to construct pSSK01; BamHI site underlined
949	5' - GCTAGGTCGACCTTTTCGCTTGCCAAACCGTCTTCA - 3'; Reverse primer to construct pSSK01; Sall site underlined
972	5' - GCTAGGCATGC TACGTGGGACGGAAGGGATGATTT - 3'; Forward primer used for constructing pSSK03; SphI site underlined
973	5' - GCTAGGGTACCCCTGAGAAAGCTCATTGATGGTGTGTCG - 3'; Reverse primer to construct pSSK03; KpnI site underlined
988	5' - GCTAGTCTAGAGCCGTGCCCAACATCAATACCATT - 3'; Forward primer used for constructing pSSK04; XbaI site underlined
989	5' - GCTAGGGATCCAGTTGCAACACCCTGGTCTCCTAA - 3'; Reverse primer to construct pSSK04; BamHI site underlined
1102	5' - GCTAGGGATCCGCAAACACTTCGAACCTTCGTA - 3'; Forward primer to amplify upstream region of <i>Fjoh_0288</i> to construct pSSK16; BamHI site underlined
1103	5' - GCTAGTCTAGAGGCATCGACACCAATATTCAT - 3'; Reverse primer to amplify upstream region of <i>Fjoh_0288</i> to construct pSSK16; XbaI site underlined
1104	5' - GCTAGTCTAGAGCTTTGTACTCAAATATTTTTTCGATA - 3'; Forward primer to amplify downstream region of <i>Fjoh_0288</i> to construct pSSK14; XbaI site underlined
1105	5' - GCTAGGTCGACCAGTTTTATCGCCTGAGCTTC - 3'; Reverse primer to amplify downstream region of <i>Fjoh_0288</i> to construct pSSK14; Sall site underlined
1201	5' - GCTAGGTCGACTACCACGAAAGCCCTATGAAAGGA - 3'; Forward primer to amplify downstream region of <i>porV</i> to construct pSSK22; Sall site underlined
1202	5' - GCTAGGCATGCCTCCTTCAGCTACTGTATCACCAAC-3'; Reverse primer to amplify downstream region of <i>porV</i> to construct pSSK22; SphI site underlined
1203	5' - GCTAGGGATCCTGCCATTGATGCGTCTGACTAC - 3'; Forward primer to amplify upstream region of <i>porV</i> to construct pSSK20; BamHI site underlined
1204	5' - GCTAGGTCGACAGGGCGCTCAATATCTTGGGCTTT - 3'; Reverse primer to amplify upstream region of <i>porV</i> to construct pSSK20; Sall site underlined
1205	5' - GCTAGGTCGACGATTTTGGCGACCGGATTGGAAAAGGA - 3'; Forward primer to amplify downstream region of <i>porU</i> to construct pSSK23; Sall site underlined
1206	5' - GCTAGGCATGCCCATACCAATTGGCTGAACGTGGT - 3'; Reverse primer to amplify downstream region of <i>porU</i> to construct pSSK23; SphI site underlined
1207	5' - GCTAGGGATCCCGACAGTTCCTGCAGTGTTCCTAAGC-3'; Forward primer to amplify upstream region of <i>porU</i> to construct pSSK21; BamHI site underlined
1208	5' - GCTAGGTCGACAAAGTATGCGATCAGGGCTTGTTCAT - 3'; Reverse primer to amplify upstream region of <i>porU</i> to construct pSSK21; Sall site underlined

Table S2. Bacteriophage sensitivity of *F. johnsoniae* wild-type and mutant strains<sup>a</sup>.

<i>ΔporV ΔsprB</i>	< 10	< 10	< 10	1.7 x 10 <sup>9</sup>	< 10	< 10	< 10	< 10
<i>ΔgldNO</i>	< 10	< 10	< 10	< 10	< 10	< 10	< 10	< 10

<sup>a</sup> Each phage stock was serially diluted, mixed with cells of *F. johnsoniae*, plated on CYE agar in CYE overlay agar, incubated 24 h at 25°C, and the number of plaque forming units (pfu) per ml of original phage stock was determined on each bacterial strain. '<10' indicates that no plaques were observed even when 0.1 ml of undiluted phage stock was tested. 'WT' indicates the streptomycin resistant *rpsI2* strain CJ1827, which is wild-type for secretion and motility and was used to construct deletion mutants. *ΔporU*, CJ2116. *ΔporV*, CJ2130. *ΔremA*, CJ1984. *ΔsprB*, CJ1922. *ΔremA ΔsprB*, CJ1985. *ΔporV ΔsprB*, CJ2445. *ΔgldNO*, CJ2090. pSSK03 carries *porV* and was used to complement the *ΔporV* mutant.

Table S3. Proteins identified in cell-free culture fluid by SDS-PAGE followed by LC-MS/MS analysis of the 60-240 kDa range<sup>a</sup>.

<b>Proteins secreted by the T9SS: These 33 proteins were absent or greatly decreased in culture fluid of <i>ΔgldNO</i> mutant cells and were restored by complementation with pTB79.</b>

<sup>a</sup> Proteins in cell-free culture fluid from wild type *F. johnsoniae* CJ1827,  $\Delta$ *gldNO* mutant CJ2090,  $\Delta$ *porV* mutant CJ2130,  $\Delta$ *porU* mutant CJ2116,  $\Delta$ *gldNO* complemented with pTB79,  $\Delta$ *porV* complemented with pSSK03, and  $\Delta$ *porU* complemented with pSSK04 were separated by SDS-PAGE, silver stained, and the regions shown in Figure 9 spanning approximately 60 to 240 kDa were cut from the gel and analyzed by LC-MS/MS. Total/unweighted spectrum counts corresponding to total number of spectra associated to a single protein and indicative of relative abundance of that protein are indicated for each of the 7 strains analyzed.

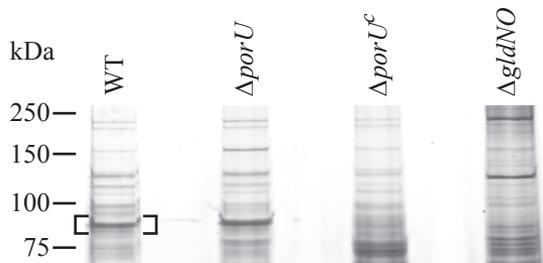

<sup>b</sup> CTD-type identified by BLASTP analysis.

<sup>c</sup> Predicted protein functions as listed on the Integrated Microbial Genomes website (<https://img.jgi.doe.gov>).

<sup>d</sup> The small number of spectra identified from wild type cells for these proteins made the prediction of secretion by the T9SS less certain. These proteins were included because no spectra were observed from  $\Delta$ *gldNO* or  $\Delta$ *porV* mutant cells and because complementation of the  $\Delta$ *gldNO* mutant resulted in 4 to 7 spectral hits for each protein.

<sup>e</sup> SprB is an abundant protein that is secreted by the T9SS but it remains attached to the cell surface rather than being released into the culture fluid (A Shrivastava et al. 2013. *J. Bacteriol.* 195: 3201-3212). This explains why it did not behave like a typical soluble secreted protein in this assay.

<sup>f</sup> ChiA has been shown to be secreted by the T9SS (see SS Kharade and MJ McBride. 2014. *J. Bacteriol.* 196:961-970). We do not know why ChiA did not behave more convincingly like a secreted protein in this analysis. The most intense band between 60 and 240 kDa in cell-free culture fluid of wild type cells (at approximately 90 kDa) was composed primarily of ChiA, and this band was not present in culture fluid of cells of the  $\Delta$ *gldNO* mutant suggesting that ChiA is secreted by the T9SS (see Figure S1 in the supplemental material for this paper).

Figure S1. The approximately 90 kDa protein present in culture fluid of wild-type cells but not in culture fluid of the *ΔgldNO* mutant corresponds to the N-terminal portion of ChiA. A) Cell-free spent medium from wild-type cells (WT) and from cells of the *ΔporU* mutant, *ΔporU* mutant complemented with pSSK04, and *ΔgldNO* mutant were separated by SDS-PAGE and proteins were detected by silver staining. The approximately 90 kDa band that was present in the cell-free culture fluid of wild-type cells (bracketed) but was not present in culture fluid of the *ΔgldNO* mutant was cut from the gel and subjected to LC-MS/MS analysis. B) The primary amino acid sequence of ChiA is shown, with the regions detected by LC-MS/MS highlighted in red. 469 spectral matches were detected to ChiA. All of these except for 3 fell between amino acids 26 and 864, which corresponds to the amino-proximal region of the protein after removal of the signal peptide. ChiA has previously been shown to be processed into N-terminal and C-terminal fragments, each of which has a chitinase catalytic domain (SS Kharade and MJ McBride. 2014. *J. Bacteriol.* **196**:961-970).
