

FIGURE S1 Pol II/GTF double mutant effects on *ADH1* transcription start site selection. TSSs at *ADH1* detected by primer extension for various transcription mutant strains. One representative experiment of at least three independent replicates is shown. GTF allele description is shown on top with a bar that indicates lanes showing Pol II alleles combined with a particular GTF allele. Relevant mutation in Pol II is labeled above each lane. Quantification of these experiments is shown in Figure 3.
