

SUPPLEMENTARY FIG. S3. APC generation of TNF α -treated ECs and EOCs normalized to untreated cells. Both ECs and EOCs consistently reduced protein C activation following TNF α treatment, although the degree of TNF α -induced reduction varied between donors. Decreases in protein C activation were not significant between untreated and treated (paired *t*-test, $p=0.094$ for ECs, $p=0.10$ for EOCs, $n=8$, analysis performed before normalization). APC, activated protein C.
