

Supplementary Figure S6 shows an analysis of ADM events in 3D explant culture in presence of the MMP inhibitor GM6001.

Supplementary Figure S6. Primary mouse pancreatic acinar cells from LSL-Kras^{G12D} mice were isolated and infected with adeno-null virus (control) or adenovirus harboring *cre* recombinase to induce expression of oncogenic Kras. Cells then were seeded in 3D *explant* organoid culture in absence or presence of GM6001 (100 nM). ADM events were determined at day 5. The asterisk indicates statistical significance.
