

Additional file 2

Map showing the geographical origin for puppies (litters) submitted for examination for canid herpesvirus-1 in Denmark, September 2012 to April 2013.

Origin of litters with at least one puppy tested positive for CaHV-1 by polymerase chain reaction (PCR) are indicated by purple dots, while PCR negative litters are shown by blue dots.

It can be seen from the map that puppies were submitted from most parts of Denmark and the PCR positive litters seem to be randomly distributed.
