Supporting Information

The neural systems representing information regularities in sensory events and action selections at different timescales
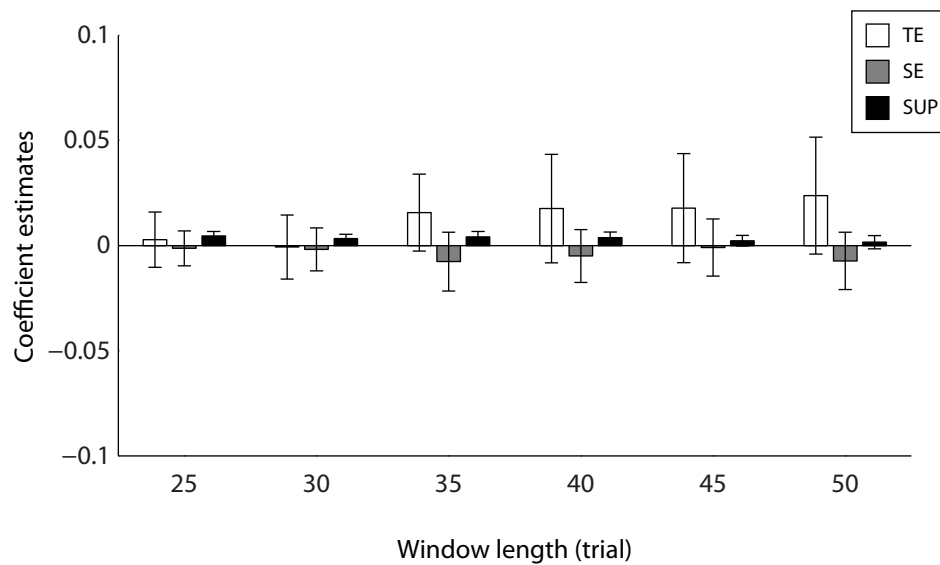

Jiaxiang zhang, James B Rowe

Figure S1. Generalized linear model of RT. Within-subject GLMs included TE, SE and SUP values as predictors of single-trial RT. Coefficient estimates from individual participants were averaged. Error bars represent the standard errors across the participants. No significant effect of TE, SE or SUP on the RT at any window length (p>0.09, Wilcoxon signed-rank test).
