

Coverage Distribution of Exons

Figure S3. Coverage distribution of exons. Graphical plot of the frequency of exon bases at a given coverage level in the W4 individual. The Y-axis represents the normalized coverage at the depth specified on the X-axis. Blue bars represent the amount of coverage in the first 15 bp of an exon, the green bars represent the amount of coverage in the last 15 bp of an exon, and the red bars represent the amount of coverage in the remaining portion of the exon. Normalized values for intron coverage were determined by summing the number of bases at each coverage level for each category (bases in the first 15 bp of an exon, bases in the last 15 bp of an exon, remainder) then dividing by the total number of bases in that category. This ratio was then multiplied by 1000 to create whole numbers.
