Figure S1E - *rpl5* gene. A) Gene order map showing the genomic position of all putative *rpl5* genes newly identified in this study (shaded in gray). The status of *atp8* is shown in Supplementary Figure S1B. B) Amino acid alignment of *rpl5*. Positions with amino acids identical or similar in >75% of sequences are shaded black or gray, respectively. A corrected frameshift mutation is highlighted in yellow and marked with an "X." C) Nucleotide alignment of the frameshift mutation located in the mononucleotide repeat region. Gaps inserted to correct the reading frame are highlighted in yellow.

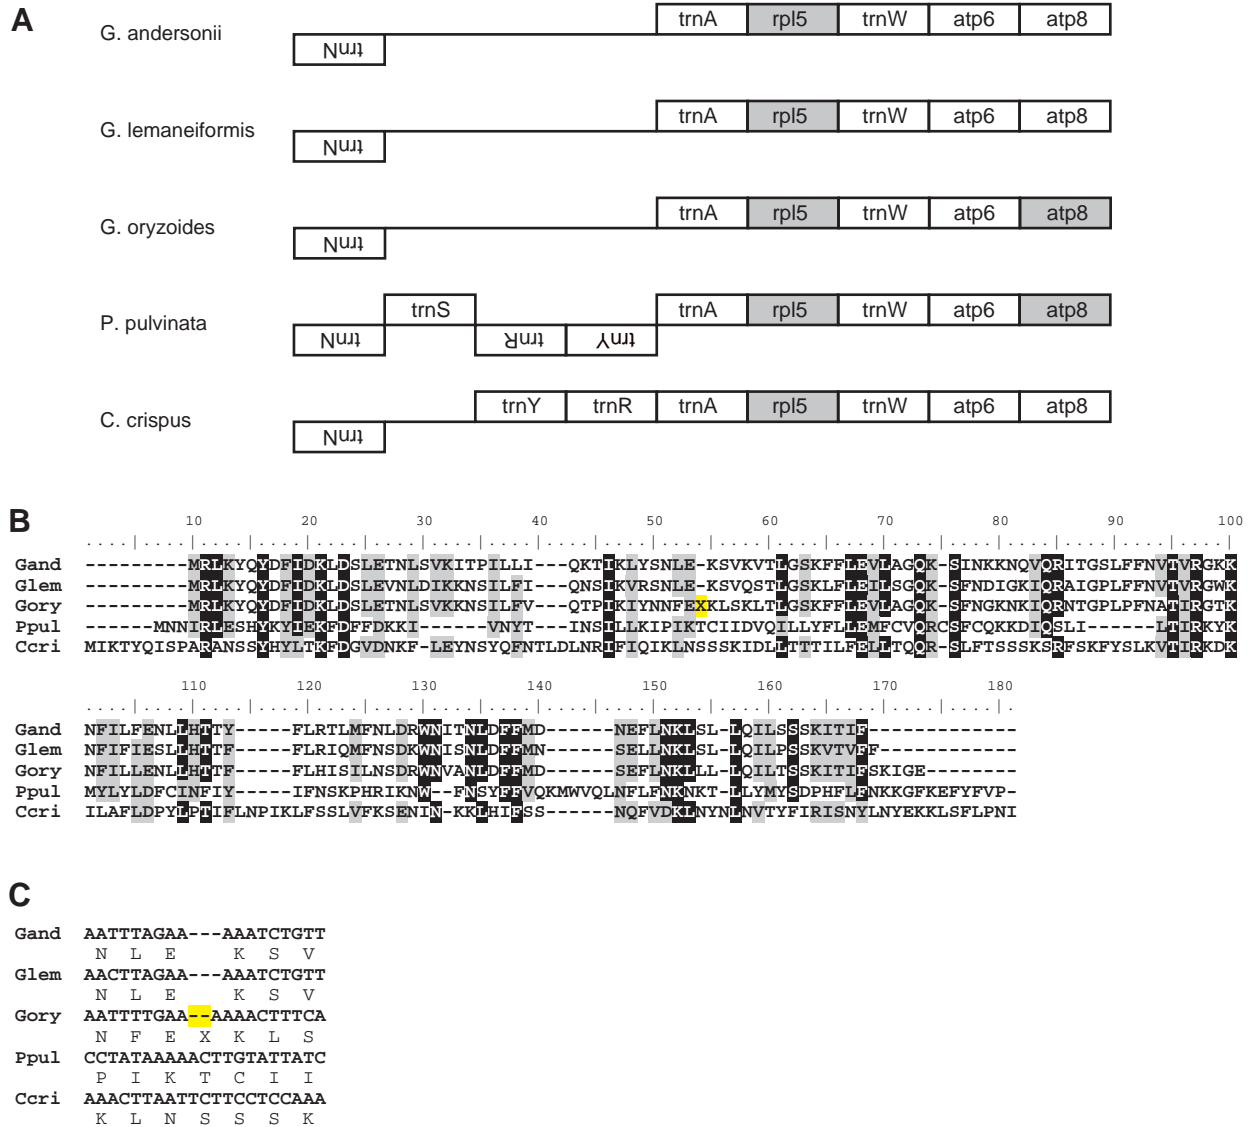

Figure S1F - *rrn5* gene. A) Gene order map showing the genomic position of all *rrn5* genes newly identified in this study (shaded in gray). In parallel, the *rrn5* was also recently identified in the species shown below, as well as all sequenced Bangiales species (Valach et al. 2014). B) Nucleotide alignment of *rrn5*. Positions with nucleotides identical in >75% of sequences are shaded black.

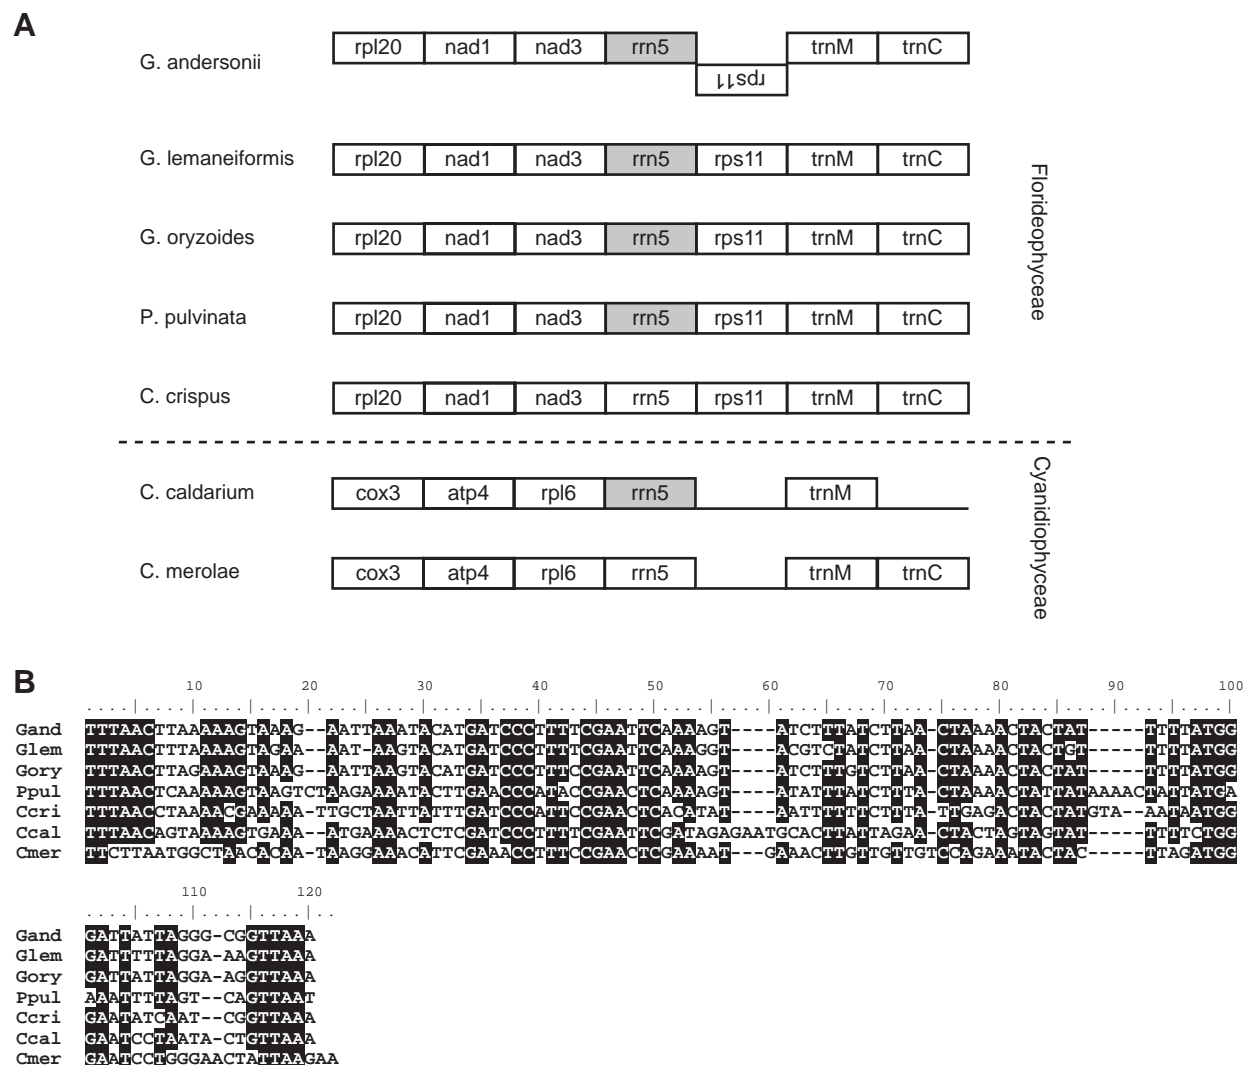

Figure S1G - *trnA-ggc* gene. A) Gene order map showing the genomic position of the *P. pulvinata* *trnA-ggc* gene (highlighted in blue) and the *trnG-gcc* gene in other Florideophyceae species. The status of *sdhC* is shown in Supplementary Figure S1C. B) Nucleotide alignment of *trnA-ggc* and *trnG-gcc*. Positions with nucleotides identical in >75% of sequences are shaded black. The anticodon mutation is highlighted in blue.

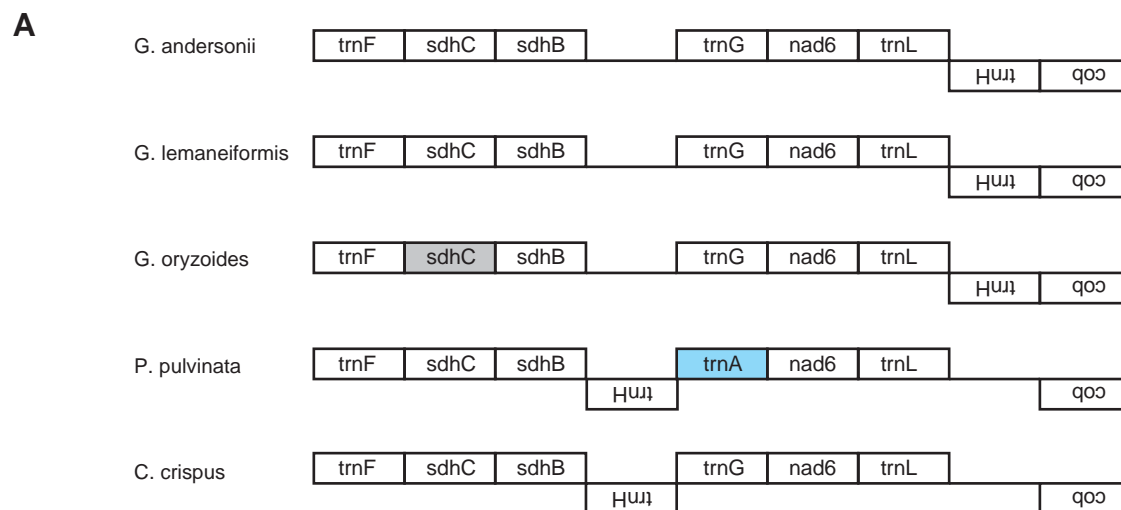

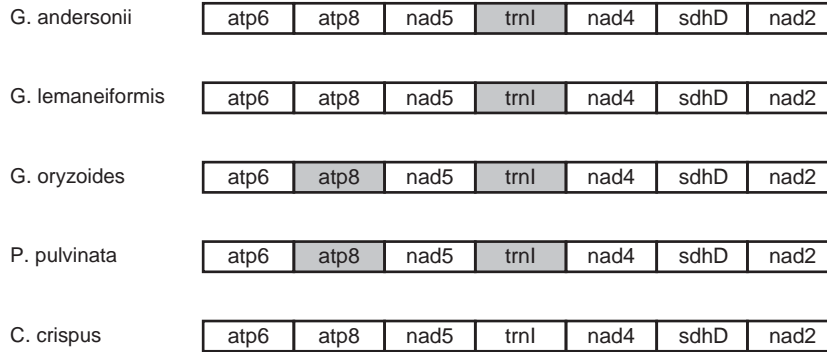

Figure S1H - *trnI*-*gau* gene and intron. A) Gene order map showing the genomic position of all *trnI*-*gau* genes newly identified in this study (shaded in gray). The status of *atp8* in *G. oryzoides* and *P. pulvinata* is shown in Supplementary Figure S1B. B) Nucleotide alignment of *trnI*-*gau* with exon and intron positions highlighted in yellow and brown, respectively. Positions with nucleotides identical in >75% of sequences are shaded black.

**A**

**B**

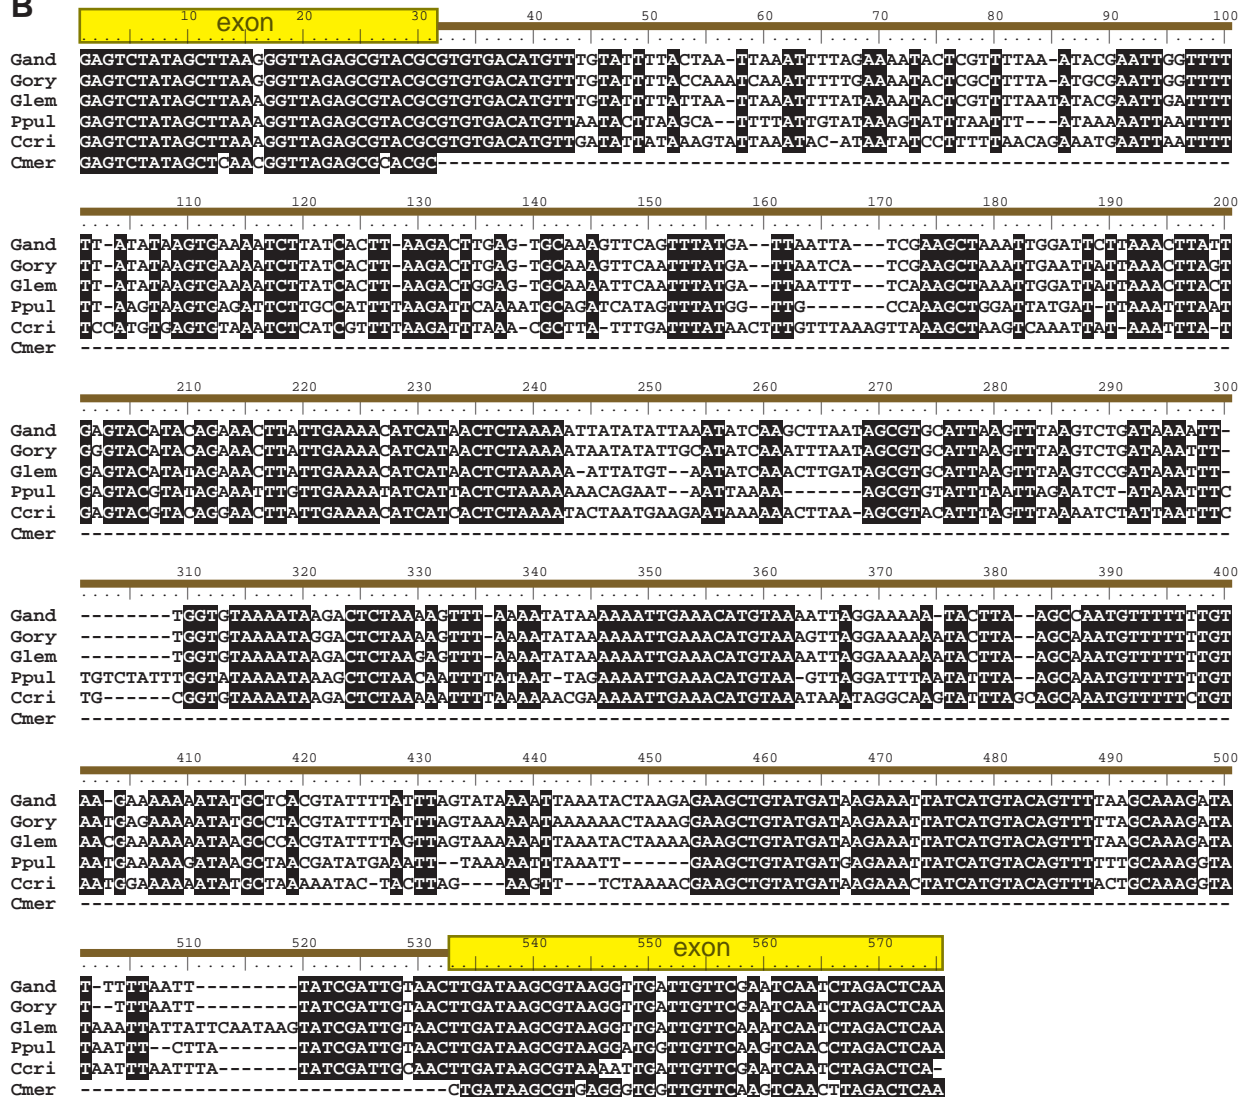

Figure S11 - *cox1* intron. A) *cox1* intron position based on old annotations present in GenBank files (shown in green for *P. pulvinata* and in yellow for *P. haitanensis* and *P. yezoensis*) and new annotations reported here (in purple). The new annotations improve exon similarity compared with intron-lacking species and restore canonical GTGYG-AC intron boundary sequences for all three intron-containing species. B) Sequence alignment of the *cox1* intron from *P. pulvinata* compared to *P. haitanensis* and *P. yezoensis*. The large internal segment of the *P. haitanensis* and *P. yezoensis* introns (encoding the majority of the IEP) is absent from *P. pulvinata* and was excluded from the alignment.

Figure S2 - Predicted stem-loop structures in the *Galdieria sulphuraria* plastid genome. Structures were predicted with the EMBOSS program einverted (<http://emboss.bioinformatics.nl/cgi-bin/emboss/einverted>), requiring a  $\geq 20$  bp stem with  $\geq 80\%$  sequence identity and a  $\leq 20$  bp loop.
