

SUPPLEMENTARY FIG. S5. Quantitative PCR analysis of proviral copy number in murine tissues isolated 6 weeks after gene transfer. The liver had the highest proviral copy/cell with 6 ± 2 and 10 ± 3 copies/cell, respectively, in the HUH7 and SKNAS tumor cohorts. The transgene copy number in the HUH7 tumor was 0.9 ± 0.2 copies/cell as compared with 0.01 ± 0.003 copies/cell in SKNAS tumor tissue isolated from the subcutaneous space. Transgene copy number in the kidneys of both cohorts was comparable at approximately 0.05 ± 0.004 copies/cells.
