

Figure S6. Permeability in *PDCD10* subjects. Each data point represents an average per patient of all permeability measurements in either lesions or white matter. (A) Permeability of CCM lesions was significantly higher in *PDCD10* patients than in *KRIT1* familial patients (* $P < 0.05$). (B) Brain permeability in white matter far (WMF) from lesions was significantly higher in the *PDCD10* (*CCM3*) patients compared to patients with sporadic lesions, without germ line CCM mutations (* $P < 0.05$) (two *PDCD10* patients did not have WMF permeability values due to high lesion numbers). Data bars are means \pm SE.
