

Figure e-7. Effects of the area under curve of systolic blood pressure during the first 24 hours on score of the modified Rankin Scale at 90 days

AUC indicates area under curve; SBP, systolic blood pressure; 95% CI, 95% confidence interval. Odds ratios and 95% CIs (shaded areas) were shown according to the area under curve of systolic blood pressure after adjustment for age, sex, region, time from onset to randomization, National Institutes of Health Stroke Scale (NIHSS) score, volume and location of hematoma, intraventricular extension and randomized treatment. The reference was the area under curve of systolic blood pressure of 3120 mmHg hour.
