

**Supplemental Table 1.**  
**Clinical Parameters of HIV-infected patients**

<b>HIV-infected patients (n = 231)</b>	
CD4+ cell count (cells/mm <sup>3</sup> )	438 ± 265
CD4+ cells (%)	24.4 ± 11.2
Log Viral load (copy/ml)	4.3 ± 0.8
IL-6 levels (pg/ml)	4.9 ± 8.3

Values are mean ± SD.

**Supplemental Table 2. Clinical and biological characteristics of HIV-infected patients according to their CD4+ T-cell counts.**

	<200 cells/mm <sup>3</sup> (n=41)	201-350 cells/mm <sup>3</sup> (n=45)	351-500 cells/mm <sup>3</sup> (n=63)	> 500 cells/mm <sup>3</sup> (n=82)
CD4+ cell count (cells/mm <sup>3</sup> )	93.5±62.8***	280.6±44.1***	414.9±43.6***	717.2±204.9
CD4+ cells (%)	8.9±6.1***	20.8±6.8***	25.9±7.5***	33.2±8.0
Log Viral Load (copy/ml)	4.9±0.8***	4.3±0.7***	4.4±0.7**	3.9±0.8
IL6 (pg/ml)	7.3±8.2**	3.3±3.1	5.6±12.8	3.8±5.4
Age (y)	40.5±10.3**	36.6±9.7	38.4±9.8*	35.0±7.9
BMI (kg/m <sup>2</sup> )	22.6±3.1	23.9±4.3	24.2±3.8	23.3±4.3
CETP activity (%)	29.6±9.1	26.1±7.5	27.7±6.8	27.3±6.9
TC (mg/dl)	161.9±45.0*	166.1±40.6*	172.7±36.3	182.7±44.8
TG (mg/dl)	138.4±87.5**	112.6±81.8	90.0±44.4	93.7±52.6
HDLC (mg/dl)	39.9±14.2	45.7±17.8	43.4±12.7	46.4±11.4

APOA1 (mg/dl)	101.8±25.7**	110.4±30.5	104.8±18.2*	113.0±20.5

BMI: Body Mass Index; TC: Total Cholesterol; TG: Triglycerides; LDLC: low density lipoprotein cholesterol; HDLC: high density lipoprotein cholesterol. No significant difference in plasma CETP activity was observed in each CD4+ subgroups (<200 CD4+/mm<sup>3</sup> or 201-350 CD4+/mm<sup>3</sup> or 351-500 CD4+/mm<sup>3</sup>) as compared to the highest CD4+ count subgroup (>500 CD4+/ mm<sup>3</sup>) in unadjusted analysis or following adjustment for plasma lipids levels, BMI, sex and age.

Values are mean ± SD. \*\*\*p<0.0001, \*\*p<0.007 and \*p<0.04 versus subgroup of HIV-infected patients displaying the highest circulating levels of CD4+ (>500 cells/mm<sup>3</sup>).

TG	-0.12	0.63
CT	0.33	0.32
apoB	-0.0009	0.55
apoA1	0.0008	0.67
CRP	0.96	0.86
IL-6	-0.36	0.04

## Supplemental Figure 1

Bar graphs showing efflux capacity of isolated HDL subspecies determined in HIV-infected subjects (n=231; closed bars) and HIV-uninfected controls (n= 200; open bars) (panels A-C-E) and in a subset of HIV-infected patients before (n= 41; closed bars) and after HAART (n= 41; hatched bars) (panels B-D-F). Fractional cholesterol efflux is expressed as a function of fixed concentrations of HDL-apoAI for ABCA1-dependent efflux (panels A and B) or HDL efflux to THP-1 macrophages (panels E and F) and of HDL-PL for SR-BI-dependent efflux (panels C and D) Values are mean  $\pm$  SEM. \*P<0.05 versus controls and ‡p<0.05 versus HIV-infected patients before treatment.

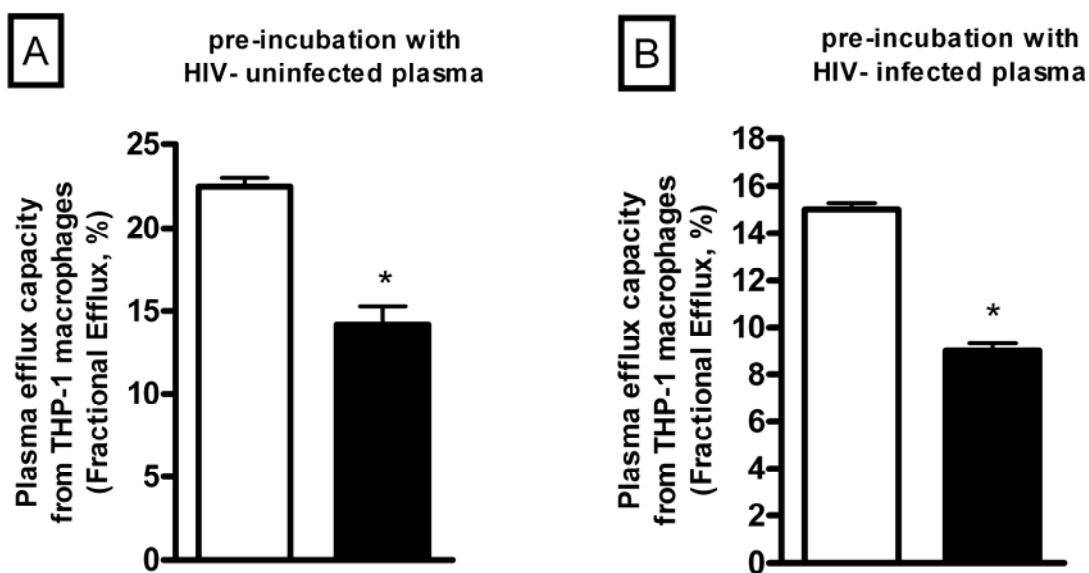

**Supplemental Figure 2**

**Panel A:** Bar graphs showing plasma efflux capacities determined in HIV-infected patients (closed bars) and HIV-uninfected controls (open bars).

**Panel B:** Bar graphs showing plasma efflux capacities determined in HIV-infected subjects before (closed bars) and after HAART (hatched bars). The ABCG1-dependent efflux was calculated as the difference between cholesterol efflux to human ABCG1-transfected Chinese hamster ovary-K1 cells and cholesterol efflux to wild-type Chinese hamster ovary-K1 cells after 4 h incubation in the presence of 40-fold-diluted plasma. Values are mean  $\pm$  SEM. ‡  $p < 0.002$  versus HIV-infected patients before treatment.

### Supplemental Figure 3

Prior to efflux experiment, human THP-1 macrophages were incubated for 24h in the presence of 10% plasma from either HIV-uninfected patients (Panel A) or HIV-infected control subjects (panel B) diluted in RPMI media. Then efflux experiments were performed during 4hours incubation in the presence of 40-fold diluted total plasma from HIV-uninfected patients ( $n=6$ ; open bars) and HIV-infected patients ( $n=6$ ; closed bars). Values are mean  $\pm$  SEM. Experiments were performed in triplicate and values correspond to the mean of two independent experiments. \* $p<0.05$  versus HIV-uninfected control subjects.
