

THE LANCET

Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: GBD 2013 Mortality and Causes of Death Collaborators. Global, regional, and national age–sex specific all-cause and cause-specific mortality for 240 causes of death, 1990–2013: a systematic analysis for the Global Burden of Disease Study 2013. *Lancet* 2015; published online Dec 18. [http://dx.doi.org/10.1016/S0140-6736\(14\)61682-2](http://dx.doi.org/10.1016/S0140-6736(14)61682-2).

Appendix to Global, regional, and national levels of age-sex specific all-cause mortality and cause-specific mortality for 240 causes of death, 1990-2013: a systematic analysis for the Global Burden of Disease Study 2013

This appendix provides further methodological detail, supplemental figures and more detailed results for all-cause mortality, causes of death, and years of life lost. The appendix is organized in ten broad sections following the structure of the main paper.

Table of Contents

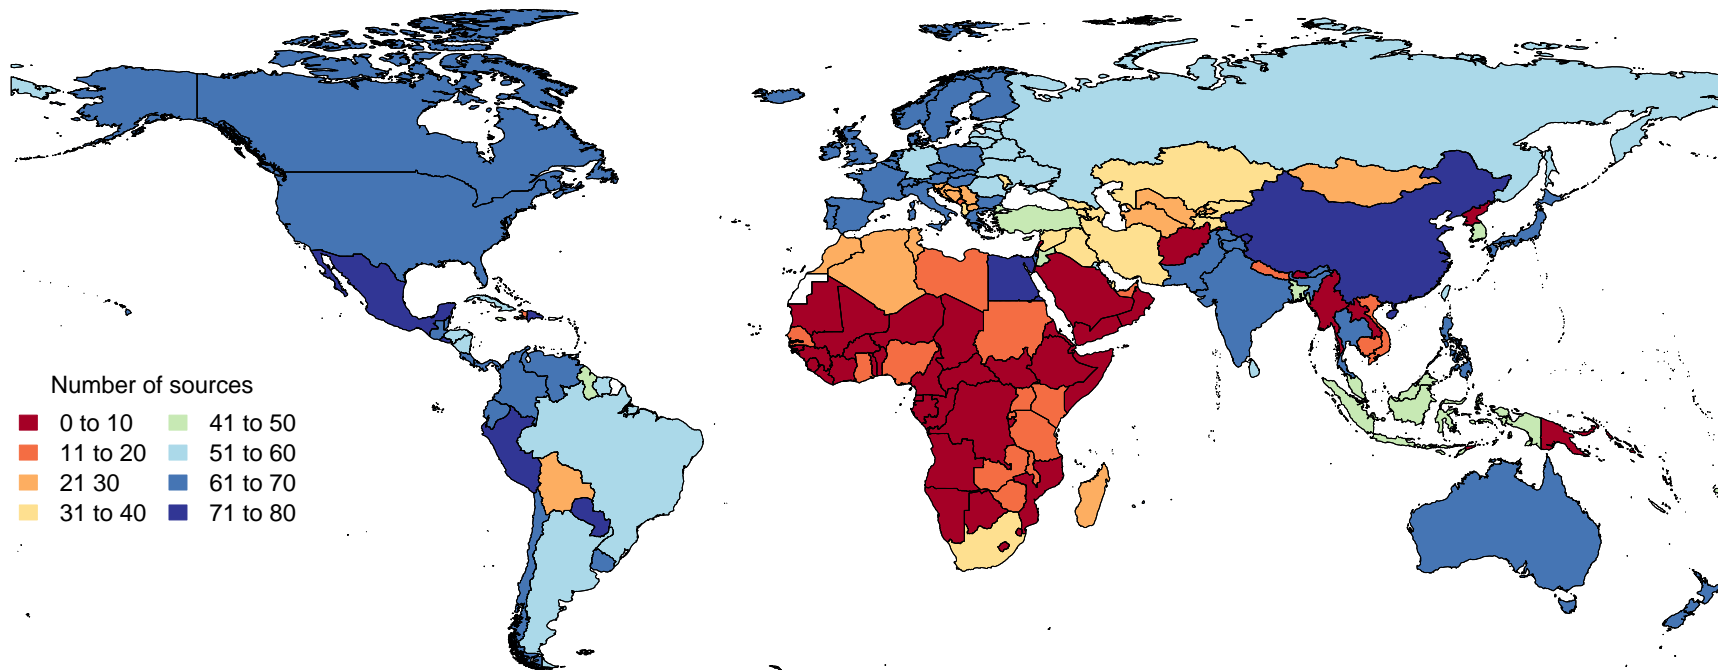

Section 1. All-cause mortality database.....	
Section 2. Modelling all-cause mortality.....	
Section 3. Supplemental and detailed results for all-cause mortality.....	
Section 4. Causes of death database.....	
Section 5. Assessing and enhancing causes of death data quality and comparability.....	
Section 6. Modelling individual causes of death.....	
Section 7. CoDCorrect algorithm.....	
Section 8. Measures of inequality.....	
Section 9. Supplemental and detailed results for causes of death.....	
Section 10. Data citation list by country.....	
Section 11. GBD 2013 covariates list.....	
Section 12. References.....	

Section 1. All-cause mortality database

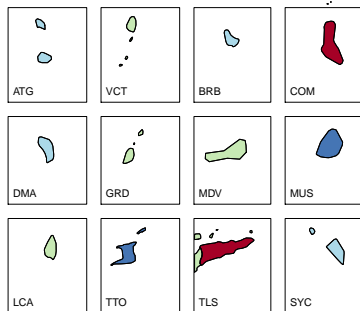

A. Country years of all-cause mortality data

Section 2. Modelling all-cause mortality

For GBD2010, we have systematically reviewed available formal demographic methods in all-cause mortality estimation. We have made significant improvement in Summary birth history method [a formal demographic tool used in estimating child mortality rate using birth histories module commonly found in censuses and household surveys such as the Demographic and Health Surveys], Sibling survival method [a method used to estimate probability of death from age 15 to age 60 using information on the survival and death of biological siblings], and Death distribution methods [a suite of methods used to assess completeness of vital registration systems]. We have also developed a new model life table system with much improved accuracy in estimation of age- and sex-specific mortality rate even in countries affected by HIV/AIDS. All these methods developments are published in peer-reviewed journals (Rajaratnam et al., 2010; Obermeyer et al., 2010; Murray et al., 2010; Wang et al., 2012).¹⁻⁴

We are continuing improving demographic techniques in estimating all-cause mortality in the upcoming iteration of GBD. Significant improvements are being made in child mortality estimation and the model life table system used to estimate age specific mortality rates. Below are changes in details:

1. Changes in modeling child mortality rate.

Trends in under-five mortality are nontrivial to estimate, as most countries do not have a vital registration system that captures all deaths. Mortality data from different sources in the same country often differ. Thus, it is desirable for child mortality estimation method to deal with source specific biases. Based on the under-five mortality data synthesis model for the Global Burden of Disease Study 2010, we incorporate data bias adjustment into the modeling process. Specifically, we include a fixed effect for source type across all countries to detect systematic differences in the level of child mortality controlling for covariates for one source type versus another. In addition, we include a random effect for each country-source. By choosing country by country a reference source or using mean of a set of sources, we can adjust on a country by country basis for the problem of compositional bias created by substantial source specific non-sampling error. By removing the systematic difference in sources, we are able to avoid estimating false trends due to partial overlap of sources with different levels of non-sampling variance.

2. Changes in model life table system.

GBD2010 employed the first model life table system that has an integrated analytical module to accurately estimate age specific rate for populations affected by HIV/AIDS. A key analytical step in this process is to “attribute” mortality rate due to HIV/AIDS as estimated by UNAIDS to specific 5-year age groups. For GBD2013, We aim to advance the methodology applied in GBD2010 by using a nonlinear hierarchical mixed effects model, as shown in the equations below, that more accurately capture the functional form of child and adult mortality with respect to levels of education, income and death rate due to HIV/AIDS in the respective age groups of 0-4 and 15-59. In addition, we are employing a relative risk approach in re-distribute excess mortality due to HIV/AIDS into detailed age groups.

A. Estimating the completeness of vital registration systems for deaths under age 5

The approach to estimating the completeness of vital registration systems for under-5 deaths is the same utilized in the Global Burden of Disease Study 2010.⁴

B. Estimating the completeness of vital registration systems for adult deaths

VR systems may not capture all adult deaths. It is important to assess the quality, or in other words, the completeness, of available VR data. Demographers have long been applying a suite of death distribution methods (DDM) including generalized growth balance (GGB), synthetic extinct generation (SEG), and a combined approach (GGBSEG) to assess completeness.⁵⁻⁹ These methods compare the age distribution of the population recorded in two censuses with the age distribution of deaths recorded between these two censuses and attempt to estimate completeness of VR. Recent modifications of these DDM methods provide estimates of completeness that, based on careful simulation studies, are more accurate and robust than traditional methods; nevertheless, these methods generate completeness estimates with substantial uncertainty intervals.¹

For this study, the process for estimating completeness of death registration for adults is based on estimates of adult completeness from three death distribution methods updated by Murray and colleagues in 2010 and information about child completeness.¹ These two sources of information are combined to generate a series of estimates of source- and country-specific adult death registration completeness from 1970 to 2013. The underlying assumption of this process is that completeness of systems will change gradually, and consequently, assessments of completeness for a given year should be informed by DDM estimates for prior and future years in that country. Further, completeness is likely to be similar among countries within a region, and we can inform estimates of completeness with levels of completeness estimated for countries in the same region or super-region by borrowing strength over space as well as time. To do this, we use a two-stage model, whereby we first predict adult completeness based on child completeness and then use a spatial-temporal regression model to incorporate information about adult completeness from the application of DDM methods.

Child completeness is calculated as the ratio of observed child mortality to estimated child mortality for a given source, country, and year. For a particular country-source, estimates of child completeness are only available for years where that data source is present, but we produce a complete time series of child completeness estimates based on a smoothing process. For country-sources with no more than three years of data, we assume a constant level of child completeness at the level of the mean of those years that are available. For country-sources with more than three years of data, we use Loess regression to fill in the time series. In order to be conservative in our out-of-sample estimates of child completeness, instead of using the Loess predictions to forecast and backcast we simply hold child completeness constant before the first observation and after the last observation. Additionally, when there is a gap of more than five years we linearly interpolate between the observations on either side of this gap instead of using the Loess predictions to fill in these years.

Once we have obtained a full series of under-5 completeness estimates for each country-source we fit the model described in equation 1.

$$\log_{10}(c_{i,s,t}^{\text{adult}}) = \alpha + \beta_1 \cdot \log_{10}(c_{i,s,t}^{\text{child}}) + \gamma_1^{\text{SR}} + \gamma_2^{\text{SR}} \cdot \log_{10}(c_{i,s,t}^{\text{child}}) + \gamma_1^{\text{R}} + \gamma_2^{\text{R}} \cdot \log_{10}(c_{i,s,t}^{\text{child}}) + \eta_{i,s} + \xi_{i,s,t} \quad 1$$

Where: $c_{i,s,t}^{\text{adult}}$ is completeness of adult deaths registration in country i , source s , at time t ;

$c_{i,s,t}^{\text{child}}$ is completeness of child deaths registration in country i , source s , at time t ;

γ terms are random effects at the region (R) and super-region (SR) level;

$\eta_{i,s}$ is a random effect at the country and source level;

$\xi_{i,s,t}$ is an error term.

This model relates adult completeness to under-5 completeness and includes super-region and region-level random effects to allow for differences in both the average level of adult completeness and the relationship between child and adult completeness at these levels. The country-source random effect captures the fundamental difference in level of completeness between different data sources.

A \log_{10} transformation is employed to make over- and under-completeness symmetric (e.g., 50% complete and 200% complete are symmetric around 0 when \log_{10} transformed) and to simplify calculation of the variance of completeness estimates in \log_{10} space, which is needed for the adult mortality estimation process. Also, to avoid allowing outlying DDM-derived estimates of adult completeness from unduly influencing the predictions from the model in equation 1, for any given set of three DDM estimates (GGB, SEG, GGBSEG) calculated from a single pair of censuses, the estimate that is furthest from 1 (i.e., complete) is excluded.

For each country-source we predict $\log_{10}(c_{i,s,t}^{\text{adult}})$ from coefficients estimated in the model above and child completeness. Not every country can be used to fit this model since DDM cannot be applied in some cases due to lack of appropriate census data. However, because the coefficients used for prediction are at the region and super-

region level, we can generate predictions from this model for all countries where estimates of child completeness are available. We do not believe that the same relationship between adult and child completeness exists for registration-based sources as for recall-based sources, so the above model is applied only to registration-based sources (primarily VR data but also sample registration systems). For sources that only include household death recall, we set an arbitrary value of 1 for the first stage values instead of making predictions from completeness from child age groups for the aforementioned reason. However, it should be noted that this set value by no means reflect the true completeness of adult age groups in the household death recall sources and it will change once we apply the spatial-temporal regression in the second stage estimation.

In the second stage, we calculate the residuals from the first stage and apply spatial-temporal smoothing to these residuals. The predicted residuals are then added back onto the first-stage predictions, generating the second-stage predictions. Spatial-temporal smoothing is carried out in the same way as in the adult mortality estimation process with three modifications: the λ and ζ parameters are set to 2.0 and 0.95; only the fixed effect local regression variant is used; and the residuals are not held constant out of sample. The registration-based sources and the non-registration-based sources are handled separately in this step.

We also need to calculate the variance of the completeness estimates, as this information is utilized in the adult mortality estimation process. To do this, we approximate the variance based on the median absolute deviation (MAD) compared to the second-stage estimates. We calculate variances at the regional level and do so separately for registration-based sources and other sources. Then, for each country-source-year, we generate 10000 simulations from a normal distribution with mean equal to the second-stage prediction for that year and variance calculated as just described. For non-registration-based sources we believe that both under- and over-reporting are possible (over-reporting may occur due to telescoping of events outside of the recall period into the recall period), and so for these sources we now exponentiate the 10000 simulations and find the mean, which serves as the final prediction for completeness. For registration-based sources we believe that only underreporting is possible, so for these sources we first truncate any simulations above 1 to 1 and then exponentiate the 10000 simulations to find the truncated mean, which will serve as the final prediction for completeness. In both cases, before exponentiating the simulations, we calculate the variance of the simulations, which is used as the variance of the completeness estimates in the adult mortality estimation process.

The final completeness estimates are used to adjust, where appropriate, the corresponding country-source-years before these data are used in the adult mortality estimation process. For countries in which we believe males and females have differential completeness, we carry out the above process separately by sex. For a small number of data points, completeness cannot be estimated using the procedure described above due to a lack of appropriate census data, and the original growth balance method is the only viable option.⁷ In previous papers, we have included a selected number of data points derived from household recall of deaths to which the Brass growth balance method had been applied. Our simulation studies suggest this method is extremely imprecise, so we have excluded these points from the analysis. This accounts for why the number of household recall of deaths data points has decreased in this analysis compared to Lozano et al.¹⁰

C. Correcting for survivor bias, zero-surviving sibships, and recall bias in the analysis of sibling histories

In countries where sources including vital registration and household death recall are scarce, sibling histories provides important information on the level and trend of adult mortality rate. We have implemented changes to the previous method, referred to as the Corrected Sibling Survival (CSS) method that are known with different biases, such that it (1) uses appropriate survival weights that account for the study design, and (2) recovers the mortality experience of the families that are not represented because none of the siblings is alive and eligible to respond to the survey. We validate these methodological developments in a range of simulation environments. We also present new ways of adjusting for recall bias and handling sparse data in survey designs where the age range of the respondents is narrower than the age range desired for estimation..^{2,4}

D. Child (5q0) and adult (45q15) mortality estimation: Gaussian process and spatial-temporal regressions

Overview of adult (5q0) mortality estimation:

We apply the child mortality estimation methodology as reported by Wang et al.¹¹ Based on the under-five mortality data synthesis model for the Global Burden of Disease Study 2010, we incorporate data bias adjustment into the modeling process. Specifically, we include a fixed effect for source type across all countries to detect systematic differences in the level of child mortality controlling for covariates for one source type versus another. In addition, we include a random effect for each country-source. By choosing country by country a reference source or using mean of a set of sources, we can adjust on a country by country basis for the problem of compositional bias created by substantial source specific non-sampling error. Once the systematic difference in sources is removed, we are able to avoid estimating false trends due to partial overlap of sources with different levels of non-sampling variance. We then apply the combination of non-linear mixed effects model, spatial-temporal regression and Gaussian Process regression to synthesize raw child mortality data after data bias adjustment to obtain a consistent time series estimates of mortality with 95% uncertainty interval for every country.

Overview of adult (45q15) mortality estimation:

For each country, we generated a time series of $_{45}q_{15}$ estimates. We modeled the underlying mortality risk separately from excess mortality due to conflict and natural disasters. To model the underlying mortality risk we relied on a three stage process that incorporates all data in our database for each country after excluding data identified as outliers or that refer to years identified to contain mortality shocks from conflict or natural disaster. In the first stage, we applied a nonlinear mixed effects model which used covariates to explain variation in $_{45}m_{15}$. In the second stage, we exploited spatial and temporal correlation in the residuals from the first stage regression by performing a smoothing process on these residuals. The smoothed residuals were then added back into the first stage regression predictions to produce an updated time-series of $_{45}q_{15}$ for each country. In the third stage, we applied Gaussian process regression (GPR) which synthesizes information from the second stage predictions and the observed data. After applying this procedure to generate estimates of the underlying mortality risk, we modeled abrupt changes in mortality by estimating the excess risk of mortality in years identified as containing a conflict or natural disaster. This estimated excess mortality risk was then added to the underlying mortality risk to produce our final time series of $_{45}q_{15}$ estimates. All analyses were carried out in Stata 13.1, R 3.0.2, and the PyMC package, version 2.0, in Python 2.5.4. A more complete description of the various stages of our modeling strategy is given below.

First stage nonlinear mixed effects regression:

The first stage nonlinear regression models country/year/sex specific adult mortality rate using key covariates: lag distributed GDP per capita, mean years of education in age group 15 to 59, and crude death rate due to HIV/AIDS in age group 15-59. We use the nonlinear mixed effects model specified in equation 2. This model was fit separately for males and females.

$$_{45}m_{15}^{\text{observed}} = \exp(\beta_1 + \beta_2 \cdot \text{Edu} + \beta_3 \cdot \ln(\text{LDI}) + \gamma_{\text{country}}) + \beta_4 \cdot \text{HIV} + \varepsilon \quad 2$$

Edu is the mean years of education for the age group 15-59; LDI is lagged distributed income; γ_{country} is a country-level random effect; and HIV is the crude mortality rate from HIV for ages 15-59. We initialized the model with starting values for each of the β coefficients equal to 0. We tested our model with different starting values, including values from a hierarchical linear mixed effects model, and found that this model was not sensitive to starting values.

The final stage 1 predictions were based on predictions from the model (equation 2 excluding the country random effect). We excluded the country random effect to facilitate modeling spatial trends in mortality in the second stage. The model predictions were then converted from $_{45}m_{15}$ to $_{45}q_{15}$ to be put into the second stage model described below.

Second stage spatial-temporal smoothing of residuals:

The first stage regression model reflects the explanatory power of the set of covariates but, as might be expected, fails to explain all of the variation in $_{45}q_{15}$. The residuals from the first stage regression are correlated in both time and space, indicating that $_{45}q_{15}$ is correlated in time and space in ways that are not fully captured by the covariates

included in this regression. We exploited this remaining pattern of variation by applying a local regression to the residuals from the first stage regression, effectively smoothing across time and space.

The local regressions were fitted separately for each of the 21 regions which have been constructed such that countries within each region share similar epidemiological profiles.¹² We applied two variations of local regression to the first stage residuals, both of which utilized the same weighting scheme to incorporate temporal and spatial relatedness. In both variants, a set of weighted linear regressions, one for each country-year of interest, were undertaken. When carrying out the regression for a given country-year of interest, all residuals in the dataset were weighted with respect to this country and year. We first weighted residuals with respect to time using a weighting function similar to that utilized in Loess regression:

$$w_t = \left(1 - \left(\frac{|r_t - r_{est}|}{1 + \operatorname{argmax}_t |r_t - r_{est}|} \right)^\lambda \right)^3 \quad 3$$

The r_t and r_{est} terms are, respectively, the year of interest and the year of the residual being weighted. The $\operatorname{argmax}_t |r_t - r_{est}|$ term is the maximum distance between the year of interest and a residual within the region. The λ parameter in this weighting function dictates how quickly the weights fall off as the distance in time increases: a larger λ implies that the assigned weights will diminish slowly with time, while a smaller λ allows the weights to diminish more rapidly with time.

We then weighted residuals with respect to space by modifying the time weights described by equation 3. Weights for residuals within the country of interest were multiplied by a factor of

$$\frac{\zeta \sum_{i \notin c_{est}} w_i}{(1 - \zeta) \sum_{i \in c_{est}} w_i} \quad 4$$

where c_{est} is the country of interest and w_i are the time weights described above. As a result of this modification, $100 \cdot \zeta$ % of the total weight was placed on residuals within the same country, and the remaining $100 \cdot (1 - \zeta)$ % of the weight was placed on residuals from other countries in the region. For countries with no residuals (i.e. countries with no data) the above factor is 0 and there was no re-weighting: consequently all of the weight remains, by necessity, in other countries in the region. We set λ to 0.8 and ζ to 0.8 based on an examination of country plots under various different settings of both parameters through iterative testing.

The first local regression variant, which we call linear local regression, is described in equation 5 and is a weighted linear regression of the residuals on year and an indicator of the residual from the country currently being estimated (if this indicator cannot be estimated, i.e. because there are no residuals in a given country, it is dropped).

$$r_{est} = \beta_0 + \beta_1 t + \beta_2 c_{est} + \varepsilon \quad 5$$

The second variant, which we call fixed effects local regression, used a weighted linear regression with no covariates. This is equivalent to a simple weighted average of the residuals.

Linear local regression incorporates information from covariates, in this case year, but extrapolation is heavily based on this covariate and in settings with sparse data this can result in implausible out-of-sample predictions. In contrast, fixed effects local regression does not incorporate an explicit time-trend and does not suffer from this problem in extrapolation, but also is less adequate at fitting the data in countries with many observations. We therefore chose to combine the estimates from both variants. As described in equation 6, we calculated the data density, d_c for each country we estimated, c_{est} , and then calculated a weighted average of the predictions from the linear local regression and fixed effects local regression where d_c % of the weight is assigned to the linear local regression and the rest to the fixed effects local regression. In this way, the final estimates for countries with more vital registration data are more heavily informed by the linear local regression and the final estimates for countries with less (or no) vital registration data are predominately informed by the fixed effects local regression, as is appropriate given the strengths and weaknesses of these two variants.

$$d_c = 100 * \left(\frac{\# \text{ VR points in } c_{\text{est}}}{\text{Maximum \# VR points in any country in the region}} \right) \quad 6$$

Residuals were logit-transformed before undergoing this smoothing; once the final estimates of the smoothed residuals were obtained for every country-year, these estimates were added back into the logit transform of the first stage regression predictions. This sum was then reverse-logit transformed; by carrying out the first two stages in logit-space we restricted the predictions to between 0 and 1. These predictions are called the second stage predictions.

Model:

The third stage of our prediction method is a Gaussian process regression (GPR) based on the model given in equation 7 where μ_t is the true $\log_{10}(45q_{15})$ at time t , $f(t)$ is the baseline mortality risk, and S_t captures excess mortality due to war and disasters. S_t is estimated independently of $f(t)$ as described in a later section. M and C describe the Gaussian process, giving the mean and covariance, respectively.

$$\begin{aligned}\mu_t &= f(t) + S_t \\ f(t) &\sim \text{GP}(M, C)\end{aligned}\tag{7}$$

For the Dominican Republic, Peru, and Madagascar, a slightly different model, described in equation 8 is used. For these countries, measurements from sibling histories and from vital registration are at different levels and the direction of the bias in each source is unknown. We therefore use a model which includes a bias term for each source (β_s).

$$\begin{aligned}\mu_t &= f(t) + \beta_s + S_{t,s} \\ \beta_s &\sim \text{Normal}(0, 0.01^2) \\ f(t) &\sim \text{GP}(M, C)\end{aligned}\tag{8}$$

Gaussian process regression is a method of Bayesian inference. We specified a prior distribution for $f(t)$, and a likelihood function which describes the data generation process; the specified prior distributions and likelihood function are described in subsequent sections. We then used Markov Chain Monte Carlo (MCMC) to approximate the posterior distribution of $f(t)$ which also incorporates information from the observed empirical estimates of adult mortality. An MCMC chain of length 5000 was produced; the first 3000 samples were discarded and the remaining 2000 were thinned by a factor of 2 for a total of 1000 simulations retained. The reported best estimates and confidence intervals were generated from the mean and the 2.5th and 97.5th percentiles of the 1000 samples, respectively.

Priors:

The prior distribution of $f(t)$ can be described in terms of the mean prior—the prior for M —and the covariance prior—the prior for C . We utilized the second stage predictions as the mean prior and used a Matern covariance function to describe the covariance prior. This covariance function incorporates three parameters: the amplitude, which controls the amount by which realizations of the Gaussian process distribution can deviate from the mean function, the scale, which controls the distance over which the function is correlated, and the degree of differentiability, which influences the smoothness of the samples from the Gaussian process.

We set the differentiability to 0.8 in countries with only complete VR data and to 2.0 in other countries. We used a lower differentiability in countries with complete VR data because in these countries we want the final estimates to follow the data closely even if the trend described is not smooth. In contrast, in countries where the data are less reliable we don't want the final estimates to be overly influenced by individual data points.

We selected prior values for the amplitude and scale based on model performance as assessed by out-of-sample predictive validity. We test five values of the scale—10, 15, 20, 25, 30—and five values of the squared amplitude—1, 2, 3, 4, and 5 times the mean squared error of the residuals from the second stage prediction model—for a total of 25 combinations of parameters. The out-of-sample predictive validity is assessed for each parameter combination by repeatedly dividing the data available into training and testing sets, fitting the model on the training sets and comparing the predictions to the corresponding data in the testing set.

We divided the data into testing and training sets 100 times. Data were divided as follows: for each region, a number X between 10 and 20 was sampled and the most recent X years of data in that region were assigned to the testing set. Then a number X between 5 and 10 was sampled, a country from within the region was sampled, and a year where there is data in that country was sampled. All data within X years of the selected year in the selected country were assigned to the testing set. This was repeated as many times as there are countries in the region; because iterations of

this procedure were independent, the data selected for the testing set may overlap. Any data that were not selected for the testing set were included in the training set.

For each testing and training division, the second stage model is fit on the training data. Then, the third stage model is also fit on the training data using each combination of scale and squared amplitude values tested for a total of 25 sets of predictions. The testing data are matched to the predictions in the corresponding country and year for each of the 25 sets of predictions. For each match we calculated the absolute relative error of the prediction compared to the empirical estimate in the testing set. We also classified each empirical estimate in the testing set as being covered or not covered by each corresponding prediction. The determination of coverage was made by calculating total variance—the sum of the variance of the empirical estimate (described below) and the variance of the GPR estimate—and then calculating a 95% confidence interval around the prediction based on this total variance and assuming a normal distribution. If the empirical estimate was within this confidence interval, it was classified as covered, and otherwise not.

Once this procedure has been carried out for all 100 testing and training divisions of the data we calculated the mean absolute relative error and the mean coverage for each combination of GPR parameters across all 100 sets of predictions. The ideal set of parameters would produce estimates with low mean absolute relative error and mean coverage close to 0.95. We used the function described in equation 9 to calculate a loss metric which incorporates both the coverage and the absolute relative error into a single measure to assess performance. Parameter combinations with lower values of this loss metric are considered preferable.

$$\text{Loss} = \begin{cases} \text{if coverage} \leq 0.95: (0.95 - \text{coverage})/5 + (\text{absolute relative error}) \\ \text{if coverage} > 0.95: (\text{coverage} - 0.95)/1 + (\text{absolute relative error}) \end{cases} \quad 9$$

The optimal parameters may differ from country to country. To allow for this, we calculated the loss function described in equation 9 separately for seven distinct groups of countries. These groups of countries are defined by the type of data which are available for estimating mortality: countries with complete VR only, countries with VR only (some or all of which is incomplete), countries with VR and other data, countries without VR data but with sibling histories, and the remaining countries. The first two groups listed are further subdivided into ‘small’ and ‘large’ population countries based on a population threshold of 50,000 15-49 year olds. For countries with no data, the highest of all selected scales and squared amplitudes from among all other countries is used.

Likelihood:

The likelihood describes the probability of observing the data given a particular set of parameters. As shown in equation 10, we used a normal model for describing the probability of observing a particular value of $\log_{10}({}_{45}q_{15})$ where the mean is given by $f(t)$ and the variance by V_t , the data variance.

$$\log_{10}({}_{45}q_{15}) \sim \text{Normal}(f(t), V_t) \quad 10$$

Data variance was calculated for each empirical observation of ${}_{45}q_{15}$ and incorporated both sampling and non-sampling variation. The method for calculating the data variance depended on the type of data:

For estimates derived from complete vital registration data we assumed that there was no non-sampling variance and included only sampling variance as computed from a binomial model. We set N equal to the national population aged 15 to 59 years and p equal to the mortality rate, ${}_{45}m_{15}$. We calculated the variance of ${}_{45}m_{15}$ from $p(1-p)/N$ and then transformed this to the variance of $\log_{10}({}_{45}q_{15})$ using the delta method.

For estimates derived from incomplete vital registration data, we wanted to include not only sampling variance but also the non-sampling variance that arises from uncertainty in the completeness estimate. For these data, the total data variance was given by the sum of the sampling variance (calculated as for complete vital registration data) and the variance of the completeness estimate (calculated as described in chapter [completeness]);

For estimates derived from sample registration systems or surveys where completeness has been assessed in the normal ways, the above procedures for complete and incomplete vital registration were followed but the national population size was replaced with the appropriate population size for the given system or survey;

For estimates derived from sources other than sibling histories where completeness could not be assessed or was assessed by the growth balance method, the highest data variance generated by the above three procedures within the same region was assigned;

Finally, for estimates derived from sibling history data, the mean absolute deviation (MAD) estimator of the variance was calculated with reference to the first stage predictions as described in equation 11.

$$\theta_{r,s}^2 = (1.4826 \cdot \text{MAD}_{r,s})^2 = 1.4826 \cdot \text{median}(|\log_{10}({}_{45}q_{15}^{\text{observed}}) - \log_{10}({}_{45}q_{15}^{\text{predicted}})|)^2 \quad 11$$

War and natural disaster model:

We excluded data from years with mortality shocks due to war and disaster to ensure that these sudden idiosyncratic increases in mortality would not affect long-term trends in mortality for a given country. These increases in mortality are, however, ultimately important to include so we implemented an additional modeling step to estimate excess mortality due to wars and natural disasters.

Information about the age and sex distribution of deaths from war and natural disaster was not available for most populations affected so we instead utilized information about the crude death rate due to war or natural disaster. For every country-year where we identified a war or disaster shock where empirical data were available we calculated the excess mortality due to that shock as described in equations 12 and 13 where ${}_{45}q_{15}^{\text{GPR}}$ and ${}_{45}M_{15}^{\text{GPR}}$ are the predicted mortality risk from GPR and the corresponding mortality rate, respectively, ${}_{45}M_{15}^{\text{observed}}$ is the observed mortality rate, and ${}_{45}M_{15}^{\text{shock}}$ is the mortality rate due to war and/or disaster.

$${}_{45}M_{15}^{\text{GPR}} = \frac{\ln(1 - {}_{45}q_{15}^{\text{GPR}})}{-45} \quad 12$$

$${}_{45}M_{15}^{\text{shock}} = {}_{45}M_{15}^{\text{observed}} - {}_{45}M_{15}^{\text{GPR}} \quad 13$$

We then related the war and disaster mortality rate, ${}_{45}M_{15}^{\text{shock}}$ to the war and disaster crude death rate, $\text{CDR}^{\text{shock}}$ using the model described in equation 14.

$${}_{45}M_{15}^{\text{shock}}_{t,c,s} = \beta * \text{CDR}^{\text{shock}}_{t,c,s} + \varepsilon \quad 14$$

Where t is time, c is country, and s is sex.

There is considerable uncertainty in the estimates of the crude death rate due to war and disaster. In order to incorporate that uncertainty into our final estimates we generated 1,000 simulations of the crude death rate based on the provided upper and lower bounds of these estimates and then paired these draws with the 1,000 simulations from the Gaussian process regression. These 1,000 pairs were then used to fit the model described in equation 14 1,000 times. As there is also uncertainty in the model described by equation 14, for each of these 1,000 sets of coefficients we re-sampled 100 sets of parameters based on the estimated mean and covariance. The estimated β s were then used to estimate the distribution of ${}_{45}q_{15}$ with the mortality shock included from ${}_{45}M_{15}^{\text{GPR}}$ as described in equation 15 and from this distribution to calculate the mean and 2.5th and 97.5th percentiles. As with previous models, this model was implemented separately for males and females.

$${}_{45}q_{15}^{\text{with shock}} = 1 - e^{-45 * ({}_{45}M_{15}^{\text{GPR}} + \hat{\beta} * \text{CDR}^{\text{shock}})} \quad 15$$

Model validation:

We assessed both the in-sample and out-of-sample predictive validity of this model for estimating adult mortality. The in-sample predictive validity of the model was calculated by comparing the final estimates of ${}_{45}q_{15}$ to the empirical estimates in our database (outliers excluded). Out-of-sample predictive validity was assessed by fitting the models to a subset of the data and comparing the resulting predictions to the remaining data. We assessed out-of-sample predictive validity in four different scenarios:

In the first scenario, we iterated through a process whereby we dropped 20% of all data at random and fit the model on the remaining 80% of data. This process was repeated 30 times with new sets of 20% of all data selected each time.

In the second scenario, we iterated through a process whereby we dropped the data from 20% of countries and fit the model on the data from the remaining 80% of countries. This process was also repeated 30 times with new sets of 20% of countries randomly selected each time.

In the third scenario, we fit the model withholding the most recent 20% of the data.

In the fourth scenario, we fit the model withholding the oldest 20% of data.

The first two scenarios were intended to assess the model's ability to predict in the absence of data, first broadly and then when missing data is concentrated in a given country, while the second two tests assessed the model's ability to forecast and backcast outside the range of available data. Across all scenarios and metrics the predictive validity generally increased from the first stage predictions to the second stage predictions and then again to the third stage predictions, confirming that at each stage of the modeling process the quality and accuracy of the predictions increases. In general, the increase in predictive validity between the first stage and the second stage was larger than between the second and third stage, suggesting that the largest gains from the multi-stage process are obtained by applying spatial-temporal smoothing. The distribution of individual error observations tends to have the widest distribution for first stage predictions, with the distributions tightening for the second stage and GPR results; indicating better overall fit to the data compared to the linear model (stage 1). As would be expected, predictive validity was higher in-sample than out-of-sample, however, the difference between the in-sample predictive validity and the out-of-sample predictive validity when 20% of the data is withheld at random is relatively small. The out-of-sample predictive validity suffers more noticeably compared to the in-sample predictive validity when 20% of countries are withheld or when the most recent and the most distant 20% of data are withheld, suggesting that the model had a harder time predicting when there were more countries without data or large spans of time without data than when there was just less data but this deficiency was not concentrated into particular countries or time periods. This decrease in the predictive validity out-of-sample is most noticeable in the second and third stage predictions; the more structured 1st stage predictions perform more consistently out-of-sample compared to in-sample, but also perform worse than the second and third stage predictions both in- and out-of-sample. The GPR model performed best in the forecasting out-of-sample scenario, an important finding since the most recent years rarely have data available.

E. New relational model life table system

For many purposes, estimates of age-specific mortality rates are useful. In settings without complete VR systems, data are often available for some summary measures of mortality such as under-5 mortality from complete or summary birth histories and mortality from age 15 to 60 from sibling histories. Model life tables, which are structured relationships between levels of age-specific mortality at different ages, can be used to generate an estimate of age-specific mortality for detailed age-groups from summary measures of mortality on children and adults. Model life tables have many other applications as well, such as simplifying the task of mortality projection or updating life tables from the most recent empirically observed data. This is true even for countries with good VR systems due to the fact that compilation/publication of VR data takes years.

An ideal model life table system has several desirable attributes. First, a model life table system should be parsimonious and require only a few entry parameters to generate a full life table. Second, it should adequately capture the range of age patterns of mortality observed in real populations and yield high predictive validity, not just measured by summary indices such as life expectancy at birth, but more importantly by age-specific mortality rates.

Third, it should provide satisfactory estimates of age-specific mortality for countries with high levels of mortality, especially those with substantial HIV/AIDS epidemics. Finally, a model life table should generate age-specific mortality with a plausible time trend, and the partial derivative of age-specific mortality should be positive with respect to entry parameters such as ${}_5q_0$ and ${}_{45}q_{15}$.

A simple and somewhat flexible model life table system was proposed by Brass.¹³ He observed that in general the logit of the l_x column in a life table could be represented as a linear transformation of the logit of the l_x column of a reference standard. Murray et al. noted that as a population moved further away from the levels of mortality in the reference standard, the assumption of linearity in logit l_x space was violated.¹⁴ A series of age-specific modification factors were proposed that allowed for the characteristic bending of the logit l_x function compared to the standard. Murray et al. also assessed the ability of this modified logit life table system to predict age-specific mortality rates. The modified logit life table system with its built-in mechanism of predicting adult mortality (${}_{45}q_{15}$) from child mortality (${}_5q_0$) has been extensively used by the World Health Organization since the early 2000s.

This system, however, suffers from two major limitations. First, when adult mortality is very high relative to child mortality, such as in the presence of an HIV epidemic, the age patterns of mortality generated do not fit well to the observed data. Second, when the modified logit life table system is applied to time series of ${}_5q_0$ and ${}_{45}q_{15}$, paradoxical trends can be generated where adult and child mortality are declining, but predicted age-specific death rates in some age-groups are increasing. We have extended the modified logit life table system to deal with these two major limitations. Wang et al. provide a more complete discussion of the development of this approach.^{4,15} We summarize these developments in brief here. There are five distinct steps.

Database for developing the model life table system

Relational model life table systems critically depend on the empirical database used to generate model life table standards and test the predictive validity of model life tables. Murray et al. used a database of 3604 life tables covering 63 countries.¹⁴ We have expanded this database to include 10711 empirical life tables from national and subnational populations that are not affected by HIV/AIDS. Two major data sources provide about 97-99% of these life tables. The Human Mortality Database (HMD)¹⁶ has over 8400 life tables from 37 countries or areas dating back to 1751. A total of 4445 life tables from this database dating between 1950 and 2011 are included in our database. We excluded life tables of poor quality as assessed by the HMD. The other major source of empirical life tables is the collection in which VR data have been evaluated using death distribution methods, as revised by Murray and colleagues (2010).¹ We include life tables only if they are evaluated as being 95% complete or higher. It's our view that accuracy of the age pattern of mortality in the raw data is to a certain degree correlated with the completeness of the data. We did make certain exceptions for the purpose of including age pattern of mortality from regions that otherwise won't be represented in our database with the strict completeness threshold. In these cases, rigorous assessment of the quality of these data is conducted. In total, we include 6036 life tables from various VR sources adjusted by the death distribution methods. We also include 14 life tables from Matlab, Bangladesh [HDSS site],¹⁷ 120 life tables from censuses especially those from Chinese provinces, and 96 life table from sample registration systems.

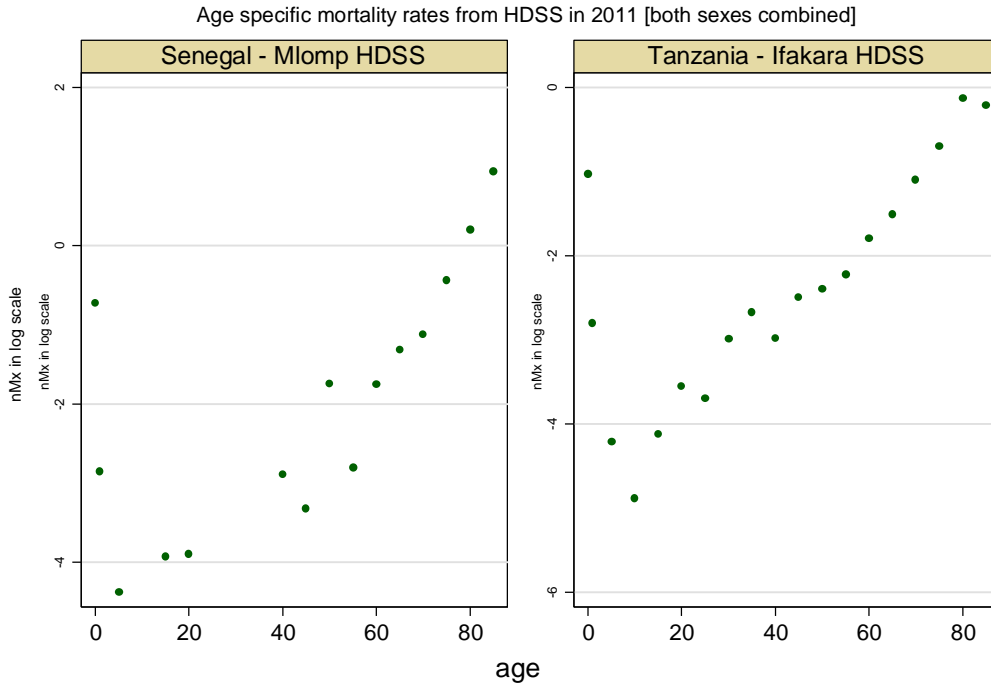

In building the empirical life table database for the new model life table system used by GBD, we have examined more data sources that we decided to exclude from our database. These include VR sources that are deemed incomplete and life tables with implausible patterns or high levels of stochastic fluctuation among age groups. All those included in the empirical life table database have been adjusted for incompleteness. In addition, we have also applied five-year moving average to empirical life tables from countries with small population size to account for random fluctuation in age specific mortality rates in a single year. These include most of the life tables from the INDEPTH network which we have decided not to include in our database. The figure below shows two age patterns of mortality from INDEPTH network. To make such life tables useful, significant level of smoothing has to be done and one has to make strong assumption in such a process.

Age specific mortality rates from HDSS in 2011 [both sexes combined]

Graphs by INDEPTH Member Centres

Web Figure 2: Age-specific mortality rates from HDSS in 2011, both sexes combined

We have included in web table 4 the source the population, sex, and source of these empirical life tables.

Model

The new relational model life table system is based on the logic that to capture the very high levels of younger adult mortality seen in populations with high HIV prevalence, we need to develop a model life table for a counterfactual population without HIV and then add on the effects of HIV by age and sex. This system is captured in three components. We first estimate counterfactual levels of ${}_5q_0$ and ${}_{45}q_{15}$ in the absence of HIV. The empirical approach taken for this step is explained below. Then a full set of age-specific death rates are generated using the model life table system from the counterfactual levels of child and adult mortality. Finally, the increase in mortality, specific to each age-group, associated with HIV is estimated.

Model for populations free of HIV/AIDS

In terms of estimating a set of age-specific death rates from ${}_5q_0$ and ${}_{45}q_{15}$ using a relational model life table, we have undertaken several innovations. A key change from previous relational model life table systems is the shift to modeling q_x in logit space rather than the l_x in the same space. Modeling q_x enables us to more precisely capture the different impacts of changes from the two entry parameters (${}_5q_0$ and ${}_{45}q_{15}$) on different age-groups. The following equation provides the life table for populations not affected by HIV/AIDS.

$$\begin{aligned} \text{logit}({}_nq_x^c) = & \text{logit}({}_nq_x^s) + \beta_x^1 \cdot (\text{logit}({}_5q_0^c) - \text{logit}({}_5q_0^s)) \\ & + \beta_x^2 \cdot (\text{logit}({}_{45}q_{15}^c) - \text{logit}({}_{45}q_{15}^s)) + \xi_x \end{aligned} \quad 16$$

Where: $\text{logit}({}_{45}q_{15}^s)$ is the logit transformation of the ${}_{45}q_{15}$ in the standard life table (development of the standard life table is presented below);

$\text{logit}({}_{45}q_{15}^c)$ is the logit transformation of the ${}_{45}q_{15}$ value for a country without HIV or the counterfactual level of ${}_{45}q_{15}$ in the absence of HIV in a country affected by HIV/AIDS;

$\text{logit}({}_5q_0^s)$ is the logit transformation of the ${}_5q_0$ in the standard population;

$\text{logit}({}_5q_0^c)$ is the logit transformation of ${}_5q_0$ for a country without HIV or the counterfactual level of ${}_5q_0$ in the absence of HIV in a country affected by HIV/AIDS;

$\text{logit}({}_nq_x^s)$ is the logit of the probability of death in the standard population from age x to $x + n$;

$\text{logit}({}_nq_x^c)$ is the logit transformation of the probability of death from age x to $x + n$ in a country without HIV or the counterfactual level of ${}_nq_x$ in the absence of HIV in a country affected by HIV/AIDS;

β_x^1 and β_x^2 are coefficients that vary by age x and which measure the impact of differences in child and adult mortality rates between a target life table and the standard life table on the estimated age pattern of mortality. In other words, both coefficients determine how much the estimated age pattern of mortality deviates from the standard by age and from linearity.

This equation proposes that the logit transformed age specific probability of dying in a target life table (c) can be represented as a function of the corresponding logit transformed age specific probability of dying in a standard life table (s) and the differences in probability of dying from age 0 to 5 in logit scale and the difference in probability of dying from age 15 to 60 in logit scale between a pairs of life tables: c and s . Life table c is the estimated HIV-free life table either for a country affected by the epidemic or not. The model is based on an empirical observation where the differences in age specific probabilities of dying in logit scale between two life tables are highly correlated with differences in ${}_5q_0$ or ${}_{45}q_{15}$ in logit scale when HIV/AIDS epidemic is not present.

Coefficients β_x^1 and β_x^2 are estimated using equation 17 with zero-HIV life tables in our database.

$$\text{logit}({}_nq_x^c) - \text{logit}({}_nq_x^s) = \beta_x^1 \cdot (\text{logit}({}_5q_0^c) - \text{logit}({}_5q_0^s)) + \beta_x^2 \cdot (\text{logit}({}_{45}q_{15}^c) - \text{logit}({}_{45}q_{15}^s)) + \xi_x \quad 17$$

In estimating the parameters, we use country-time specific and region (i.e. global burden of disease region) specific standard for each life table not affected by HIV/AIDS in our database (other aggregated standard life tables by

different geographical or epidemiological clustering criteria are also possible). Country-time specific standard life tables are used whenever an empirical life table from the same country within a 15-year time frame is available in our database. 69,265 unique pairs of life tables are matched using our life table database with time lags between 1 and 15 years. Region specific standard life tables are generated by collapsing all zero-HIV life tables in our database from the same global burden of disease region by sex. We then pair up all zero-HIV life tables in our database with the generated region specific life tables. This gives us an additional 5,976 pairs of life tables.

The estimated $\hat{\beta}_x^1$ and $\hat{\beta}_x^2$ are shown in **Web Table 5**. We limit the effects of ${}_5q_0$ and ${}_{45}q_{15}$ to certain age groups to avoid implausible outputs when ${}_5q_0$ and ${}_{45}q_{15}$ from a population change in opposite directions. With the results in **Web Table 5**, we can generate full life tables for populations not affected by HIV/AIDS. (The procedure discussed so far will generate age specific mortality up to age group 80-84 only. Age specific mortality after age 85 is generated using a separate model that will be discussed later in this article.) The values of ${}_5q_0$ and ${}_{45}q_{15}$ serve as points of entry (or entry parameters) for this new model life table system.

For GBD2013, we have updated our procedure of standard life table computation to take into account empirical relationship between differences in age pattern of mortality and geography, and time. To generate a standard, we first calculate the Mahalanobis distance between the target life table and all zero-HIV empirical life tables of the same sex in our database based on ${}_5q_0$ and ${}_{45}q_{15}$ (in logit scale). The Mahalanobis distance between two sets of ${}_5q_0$ and ${}_{45}q_{15}$ are defined as:

$$D_M^i(Q^i) = \sqrt{(Q^i - O)^T S^{-1} (Q^i - O)} \quad 18$$

where O is a multivariate vector representing entry parameters ${}_5q_0$ and ${}_{45}q_{15}$ in logit scale.

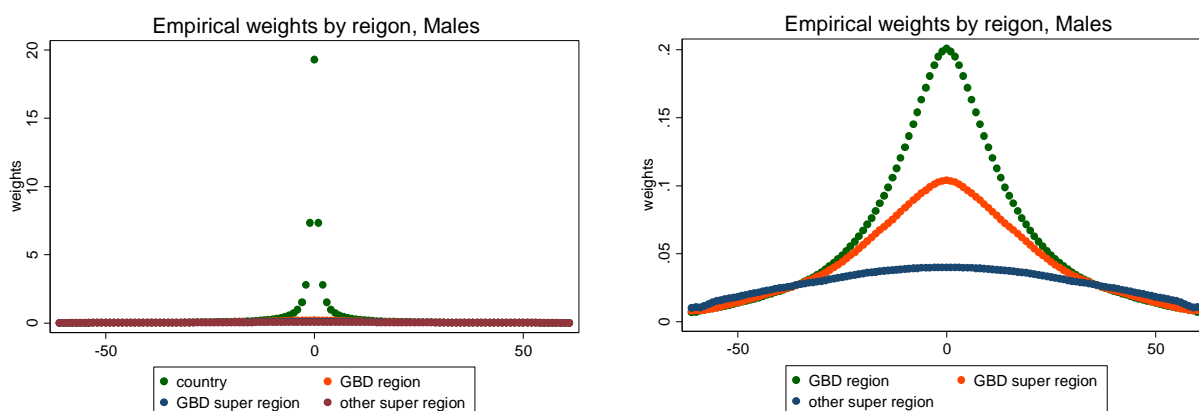

$Q^i = (\log it({}_5q_0^i), \log it({}_{45}q_{15}^i))$ is a multivariate vector that corresponds to an empirical life table i in our life table database. We choose Mahalanobis distance over Euclidean distance due to the fact that ${}_5q_0$ and ${}_{45}q_{15}$ are highly correlated in logit space (the correlation coefficients are 0.58 and 0.87 for males and females, respectively), and Mahalanobis distance takes the covariance matrix of ${}_5q_0$ and ${}_{45}q_{15}$ in logit scale into consideration when calculating the distance between any pair of life tables. We then keep the potentially most similar life tables as measured by the Mahalanobis distance. The number of life tables retained is based on the numbers of empirical life tables from the same country included in our database. For example, for developed countries with empirical life table for every year, only 10 most similar life tables and all life tables from the same country are kept for additional analysis.

In the second step, instead of obtaining a simple arithmetic mean of all selected life tables, we apply empirical weights to each selected life table and compute the weighted average. We have examined all possible pairs of life tables of the same sex in our empirical database by country, GBD region, and GBD super region. For each pair of life tables, we compute the sum of difference in ${}_nq_x$ in logit space. We then get the mean of such values by sex, time difference in years of observation, and whether the pair of life tables are from the same country, same GBD region, or same GBD super region. The reciprocal of the squared means are used as empirical weights. The figure below shows the empirical weights by lag in time and geographic region for males. This process gives more weights to life tables closer in terms of time and geographic location.

The counterfactual life table, c , or the final life table, p , when HIV/AIDS is non-existent in the population, is estimated using a standard life table, s , which is generated using the aforementioned procedure and coefficients

$\hat{\beta}_x^{1,g}$ and $\hat{\beta}_x^{2,g}$ as shown in **Web Table 5**.

Introducing AIDS

Currently, perhaps the most challenging issue for all existing model life table systems is providing plausible age specific mortality estimates given an HIV/AIDS epidemic. Both widely used model life table systems, the Coale-Demeny model life tables and the Modified Logit Life Table system, are largely based on empirical life tables from the pre-HIV era. In addition, they do not provide an integrated solution to the problem of incorporating HIV/AIDS. For GBD2013, we apply an innovative way of adding excess mortality due to HIV to specific age groups by the type of the HIV/AIDS epidemic: concentrated or generalized. In this step, we take all available vital registration data with

ICD10 coded causes of death. Then by sex, and type of epidemic, we run Seemingly Unrelated Regression (SUR) on the relative mortality risk due to HIV using constant only as shown in equation 19. The relative risks here are defined as the ratio HIV specific mortality in a specific age group and age group 40-44.

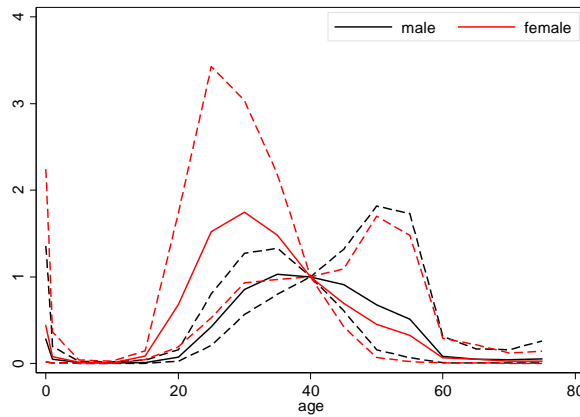

$$R_i = \alpha_i + \xi_i \quad 19$$

where i indicates different age groups, 0, 1-4, 5-9, 10-14, etc.

$$R_i = \frac{{}_n M_x^{HIV}}{{}_5 M_{40}^{HIV}}$$

We then repeatedly re-sample from the variance and covariance matrix of the estimated constants and residuals to get the mean and 95% uncertainty intervals of estimated relative risks by sex, age and types of epidemic. The figure below shows the relative risks for generalized epidemic.

Web Figure 4: Relative risks for generalized epidemic

When crude death rates or age/sex specific death rates from HIV/AIDS are available, we use the equations described below to model the impact of HIV/AIDS. Here, we express child or adult mortality as functions of education, income, and crude death rate due to HIV/AIDS as described in the following equations:

$$\left({}_5 m_0\right)_{i,t} = e^{(\alpha^c + \beta_1^c \cdot \text{Edu}_{i,t}^c + \beta_2^c \cdot \text{LDI}_{i,t} + \gamma_i^c)} + \kappa_c \cdot (\text{CDR}_c^{\text{HIV}})_{i,t} + \xi_{i,t}^c \quad 20$$

$$\left({}_{45} m_{15}\right)_{i,t} = e^{(\alpha^a + \beta_1^a \cdot \text{Edu}_{i,t}^a + \beta_2^a \cdot \text{LDI}_{i,t} + \gamma_i^a)} + \kappa_a \cdot (\text{CDR}_a^{\text{HIV}})_{i,t} + \xi_{i,t}^a \quad 21$$

Where: a indicates parameters and variables specific to adult age-groups (15-59);

c indicates parameters and variables specific to child age-groups (0-4);

$\text{Edu}_{i,t}^c$ is maternal education in country i at time t ;

$\text{Edu}_{i,t}^a$ is population-weighted education for adult age-groups in country I at time t ;

$\text{LDI}_{i,t}$ is lagged distributed income in country i at time t ;

γ_i terms are country-level random effects;

$(\text{CDR}_c^{\text{HIV}})_{i,t}$ and $(\text{CDR}_a^{\text{HIV}})_{i,t}$ are the crude death rate from HIV for the child and adult age-groups, respectively, in country i at time t ;

κ_c and κ_a are the coefficients giving the relationship between the crude death rate from HIV and the change in the survival probability;

ξ , $\xi_{i,t}^c$ and $\xi_{i,t}^a$ are error terms.

Essentially we model the difference between observed child/adult mortality rates and their HIV-free counterparts as a function of crude death rates due to HIV/AIDS in the respective age groups. Both equations 20 and 21 are

indirectly based on the mathematical relationship between probability of survival and mortality rates in the same age group as described by the following equations,

$${}_5n p_x^{\text{obs.}} = e^{-\int_x^{x+5n} \mu(a) da} = \exp\left(-\sum_x^{x+5*(n-1)} 5 \cdot {}_5 M_a\right) = \exp\left(-\sum_x^{x+5*(n-1)} 5 \cdot ({}_5 M_a^{\text{HIV}} + {}_5 M_a^{\text{non-HIV}})\right) \quad 22$$

From equation 22 we can see that probability of surviving, ${}_5n p_x^{\text{obs.}}$, in natural log space can be expressed as the sum of all age specific mortality rates from HIV and other non-HIV diseases. This enables us to model the difference of probability of survival between the observed values and the HIV-free scenario in log space on the crude death rates of HIV/AIDS, which is viewed as a proxy for the unobserved true mortality rates due to HIV/AIDS.

Using equation 20 and 21, we can estimate what the child mortality and adult mortality rates (${}_5q_0$ and ${}_{45}q_{15}$) would be if HIV/AIDS are removed from the population. This can be done by the product of estimated HIV coefficients and crude death rates due to HIV/AIDS from the estimated all-cause child and adult mortality rates. These HIV-counterfactual child and adult mortality rates are then used the selected standard life table and generate HIV-free life table using the procedure described by equation 16. Through an iteration process, we then estimate age specific mortality rates due to HIV/AIDS and add them to the HIV-free age pattern of mortality just estimated so that ${}_5q_0$ and ${}_{45}q_{15}$ from the end of the iteration process match the all-cause child and adult mortality rates.

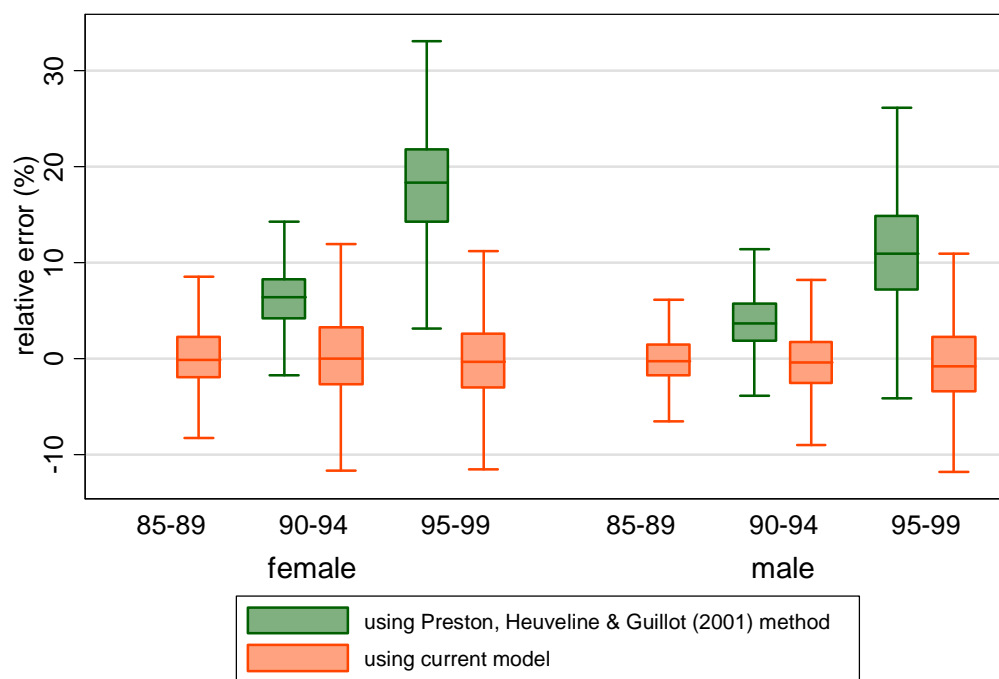

Extending to oldest ages

To extrapolate age-specific mortality beyond age 85, the Gompertz law of mortality and other functional model age pattern of mortality methods are generally used.^{18,19} Here, we have developed a new model with better predictive validity than existing methods. Age-group dummies and probability of dying from age 80 to 84 in logarithmic scales are used to estimate the difference in age-specific probability of dying in logarithmic scale between two consecutive age-groups, as described in the following equation:

$$\ln\left({}_5 q_x^{j,t,g}\right) - \ln\left({}_5 q_{x+5}^{j,t,g}\right) = \alpha^g + \beta_x^g \cdot \text{age} + \gamma^g \cdot \ln\left({}_5 q_{80}^{j,t,g}\right) + \eta_j^g + \xi_x^{j,t,g} \quad 23$$

Here, j refers to country, g refers to sex, and t refers to time. Parameters are estimated using data from the HMD.¹⁶ The parameters estimated from the above model are then used to generate age-specific probability of death from age 85 to 109. The validation process is done using a 20% out-of-sample procedure, and we repeat this process 100 times and compare the performance of our model with a modified Gompertz model.²⁰ The results of the validation, as shown in **Web Figure 5**, suggest that our model outperforms the modified Gompertz model in terms of relative error in predicted age-specific mortality rates.

Web Figure 5: Relative error in estimated probability of death

Uncertainty in the estimated life tables

One important attribute of this current study is the inclusion of uncertainty in every single step of the GBD mortality estimation process. We have integrated uncertainty from the entry parameters (${}_5q_0$ and ${}_{45}q_{15}$) and the coefficients of each model we have discussed in this section based on the method illustrated by King et al.²¹ Essentially, the model life table process just described is repeated 1,000 times based on randomly paired entry parameters (thus different standard life tables) and model coefficients. As a result of this process, in countries where uncertainties in estimated entry parameters are high, we can have wide uncertainty intervals in the estimated deaths, which is the final product of the GBD mortality process.

F. New Population Structure for Standardization

The WHO last released a global age standard in 2001. The world has experienced substantial change in global demography since then, inciting the need for a new standard population for computing age-standardized rates.

The old WHO standard used population data from the United Nations Population Division's World Population Prospects (WPP) 1998 revision. It was calculated using the non-weighted average across all countries of each age-specific population percentage in each 5-year age group up to the terminal group of 100+, using estimates from the years 2000-2025. We mirrored this technique with three key adaptations: (1) we used population data from the WPP 2012 revision for years 2010-2035; (2) we used the interpolated population in age group 0-1 provided in the WPP 2012 revision to separate ages 0-1 and 1-4; (3) we applied the non-weighted mean proportion across countries of populations in the early neonatal (0-6 days), late neonatal (7-27 days), and post neonatal (28-364 days) age groups from the GBD2013 study in years 2010-2013 to the new age 0-1 standard to get standard populations in these age groups. This new standard reflects an up-to-date age structure that facilitates more relevant comparisons between countries when computing age-standardized rates.

Web Table 13 - Source list by country and site, source type, study site, time period, age range, and deaths excluding sources on LRI and diarrhea etiologies

Geography	Source Type	Study Site	Time Period*	Age Range	Deaths used in analysis**
-----------	-------------	------------	--------------	-----------	---------------------------

* When data observations are reported in a range of years, the midpoint was used for analysis.

** Deaths recorded in counts, death rates, maternal mortality rates (MMR), and cause-specific mortality fractions (CSMF) were used in analysis.

Section 5. Assessing and enhancing causes of death data quality and comparability

A. Completeness sensitivity testing

We conducted completeness sensitivity testing as part of the GBD 2010 Study. The approach and results of that testing can be found in Lozano et al.²²

B. Mapping revisions and variants of the ICD

Web Table 14: List of International Classification of Diseases (ICD) codes mapped to the Global Burden of Disease cause list for causes of death

Web Table 14 - List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for Causes of Death

Cause Name	ICD10 Code	ICD9 Code

Motorcyclist road injuries	V20-V29.9	E81.02,E81.03,E81.12,E81.13,E81.22,E81.23,E81.32,E81.33,E81.42,E81.43,E81.52,E81.53,E81.62,E81.63,E81.72,E81.73,E81.82,E81.83,E81.92,E81.93,E82.02,E82.03,E82.12,E82.13,E82.22,E82.23,E82.32,E82.33,E82.42,E82.43,E82.44,E82.45,E82.46,E82.47,E82.48,E82.49,E82.50,E82.51,E82.52,E82.53,E82.54,E82.55,E82.56,E82.57,E82.58,E82.59,E82.60,E82.61,E82.62,E82.63,E82.64,E82.65,E82.66,E82.67,E82.68,E82.69,E82.70,E82.71,E82.72,E82.73,E82.74,E82.75,E82.76,E82.77,E82.78,E82.79,E82.80,E82.81,E82.82,E82.83,E82.84,E82.85,E82.86,E82.87,E82.88,E82.89,E82.90,E82.91,E82.92,E82.93,E82.94,E82.95,E82.96,E82.97,E82.98,E82.99
Motor vehicle road injuries	V30-V79.9,V87.2,V87.3	E81.00,E81.01,E81.10,E81.11,E81.20,E81.21,E81.30,E81.31,E81.40,E81.41,E81.50,E81.51,E81.60,E81.61,E81.70,E81.71,E81.80,E81.81,E81.90,E81.91,E82.00,E82.01,E82.10,E82.11,E82.20,E82.21,E82.30,E82.31,E82.40,E82.41,E82.42,E82.43,E82.44,E82.45,E82.46,E82.47,E82.48,E82.49,E82.50,E82.51,E82.52,E82.53,E82.54,E82.55,E82.56,E82.57,E82.58,E82.59,E82.60,E82.61,E82.62,E82.63,E82.64,E82.65,E82.66,E82.67,E82.68,E82.69,E82.70,E82.71,E82.72,E82.73,E82.74,E82.75,E82.76,E82.77,E82.78,E82.79,E82.80,E82.81,E82.82,E82.83,E82.84,E82.85,E82.86,E82.87,E82.88,E82.89,E82.90,E82.91,E82.92,E82.93,E82.94,E82.95,E82.96,E82.97,E82.98,E82.99
Other road injuries	V80-V80.929,V82-V82.9	E81.04,E81.05,E81.14,E81.15,E81.24,E81.25,E81.34,E81.35,E81.44,E81.45,E81.54,E81.55,E81.64,E81.65,E81.74,E81.75,E81.84,E81.85,E81.94,E81.95,E82.04,E82.05,E82.14,E82.15,E82.24,E82.25,E82.34,E82.35,E82.44,E82.45,E82.46,E82.47,E82.48,E82.49,E82.50,E82.51,E82.52,E82.53,E82.54,E82.55,E82.56,E82.57,E82.58,E82.59,E82.60,E82.61,E82.62,E82.63,E82.64,E82.65,E82.66,E82.67,E82.68,E82.69,E82.70,E82.71,E82.72,E82.73,E82.74,E82.75,E82.76,E82.77,E82.78,E82.79,E82.80,E82.81,E82.82,E82.83,E82.84,E82.85,E82.86,E82.87,E82.88,E82.89,E82.90,E82.91,E82.92,E82.93,E82.94,E82.95,E82.96,E82.97,E82.98,E82.99
Other transport injuries	V00-V00.898,V05-V05.99,V81-V81.9,V83-V86.99,V88.2,V88.3,V91-V91.9,V93-V98.8	E80.0-E80.02,E80.1-E80.12,E80.2-E80.22,E80.3-E80.32,E80.4-E80.42,E80.5-E80.52,E80.6-E80.62,E80.7-E80.72,E81.07,E82.07,E82.17,E82.62,E82.72,E82.82,E83.1-E83.19,E83.3-E83.89,E84.0-E84.99,E92.91
Unintentional injuries	V90,V90.0,V90.01-V90.9,V92-V92.9,W00-W46.2,W49-W62.9,W64-W70.9,W73-W81.9,W83-W94.9,W97.9,W99-X06.9,X08-X29.9,X40-X40.9,X43-X43.9,X46-X48.9,X50-X54.9,X57-X58.9,Y38.9-Y84.9,Y88-Y88.3	E00.0-E03.0,E83.0-E83.09,E83.2-E83.29,E85.03-E85.089,E85.48-E85.569,E85.6-E85.899,E86.02-E86.999,E87.0-E87.69,E87.8-E88.699,E88.8-E89.909,E90.01-E90.019,E90.11-E90.119,E90.2-E90.4,E90.41-E90.699,E91.0-E91.399,E91.5-E92.889,E92.92-E92.94,E93.0-E94.99
Falls	W00-W19.9	E88.0-E88.699,E88.8-E88.89,E92.93

Web Table 14 - List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for Causes of Death		
Cause Name	ICD10 Code	ICD9 Code
Drowning	V90,V90.0,V90.01-V90.9,V92-V92.9,W65-W70.9,W73-W74.9	E83.0-E83.09,E83.2-E83.29,E91.0-E91.099
Fire, heat, and hot substances	X00-X06.9,X08-X19.9,X20.5	E89.0-E89.909,E92.4-E92.499,E92.94
Poisonings	X40-X40.9,X43-X43.9,X46-X48.9	E85.03-E85.089,E85.48-E85.519,E85.53-E85.569,E85.6-E85.899,E86.02-E86.999,E92.92
Exposure to mechanical forces	W20-W38.9,W40-W43.9,W45.0-W45.2,W46-W46.2,W49-W52,W52.3,W75-W76.9	E91.3-E91.319,E91.6-E92.299,E92.81-E92.87
Unintentional firearm injuries	W32-W34.9	E92.2-E92.299,E92.87
Unintentional suffocation	W75-W76.9	E91.3-E91.319
Other exposure to mechanical forces	W20-W31.9,W35-W38.9,W40-W43.9,W45.0-W45.2,W46-W46.2,W49-W52,W52.3	E91.6-E92.199,E92.81-E92.86
Adverse effects of medical treatment	Y38.9-Y84.9,Y88-Y88.3	E85.52-E85.529,E87.0-E87.69,E87.8-E87.99,E93.0-E94.99
Animal contact	W52.0-W52.2,W52.4-W62.9,W64-W64.9,X20-X20.4,X20.6-X29.9	E90.5-E90.699
Venomous animal contact	X20-X20.4,X20.6-X29.9	E90.5-E90.599
Non-venomous animal contact	W52.0-W52.2,W52.4-W62.9,W64-W64.9	E90.6-E90.699
Foreign body	W44-W45,W45.3-W45.9,W78-W80.9,W83-W84.9	E91.1-E91.209,E91.38-E91.399,E91.5-E91.509
Pulmonary aspiration and foreign body in airway	W78-W80.9,W83-W84.9	E91.1-E91.209,E91.38-E91.399
Foreign body in other body part	W44-W45,W45.3-W45.9	E91.5-E91.509
Other unintentional injuries	W39-W39.9,W77-W77.9,W81-W81.9,W85-W94.9,W97.9,W99-W99.9,X50-X54.9,X57-X58.9	E00.0-E03.0,E90.01-E90.019,E90.11-E90.119,E90.2-E90.4,E90.41-E90.499,E91.32-E91.339,E92.3-E92.399,E92.5-E92.809,E92.88-E92.889
Self-harm and interpersonal violence	X60-Y08.9,Y87.1	E90.40-E90.409,E95.0-E96.9
Self-harm	X60-X84.9	E95.0-E95.9
Interpersonal violence	X85-Y08.9,Y87.1	E90.40-E90.409,E96.0-E96.9
Assault by firearm	X93-X94.0,X94.3-X94.7,X94.9-X95.9,X96.5	E96.5-E96.54
Assault by sharp object	X99-X99.9	E96.6
Assault by other means	X85-X92.9,X94.1,X94.2,X94.8,X96-X96.4,X96.6-X98.9,Y00-Y08.9,Y87.1	E90.40-E90.409,E96.0-E96.4,E96.55-E96.59,E96.7-E96.9
Forces of nature, war, and legal intervention	X30-X39.9,Y35-Y38.893,Y89.0,Y89.1	E90.0-E90.009,E90.09-E90.109,E90.18-E90.199,E90.7-E90.99,E97.0-E97.99,E99.0-E99.91
Exposure to forces of nature	X30-X39.9	E90.0-E90.009,E90.09-E90.109,E90.18-E90.199,E90.7-E90.99
Collective violence and legal intervention	Y35-Y38.893,Y89.0,Y89.1	E97.0-E97.99,E99.0-E99.91
Still born	P95-P95.9	768.0,768.1

Web Table 14 - List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for Causes of Death

Web Table 15. Disaggregation of ICD9 Basic Tabulation: Example B14.9 "Remainder of B14: Malignant neoplasm of lymphatic and haemopoietic tissue" in females

Web Table 15 - Disaggregation of ICD9 basic tabulation: Example B14.9 "Remainder of B14: Malignant neoplasm of lymphatic and haemopoietic tissue" in females											
ICD9	Target Name	GBD Cause	Infants	1 to 4	5 to 9	10 to 14	15 to 19	20 to 24	25 to 29	30 to 34	35 to 39
200	Lymphosarcoma and reticulosarcoma and other specified malignant tumors of lymphatic tissue	Non-Hodgkin lymphoma	0.6	0.293	0.378	0.41	0.281	0.418	0.329	0.341	0.286
202	Other malignant neoplasms of lymphoid and histiocytic tissue	Non-Hodgkin lymphoma	0.4	0.659	0.622	0.564	0.702	0.567	0.646	0.624	0.613
203	Multiple myeloma and immunoproliferative neoplasms	Multiple myeloma	0	0.049	0	0.026	0.018	0.015	0.025	0.035	0.101
ICD9	Target Name	GBD Cause	40 to 44	45 to 49	50 to 54	55 to 59	60 to 64	65 to 69	70 to 74	75 to 79	80 plus
200	Lymphosarcoma and reticulosarcoma and other specified malignant tumors of lymphatic tissue	Non-Hodgkin lymphoma	0.167	0.184	0.148	0.175	0.145	0.177	0.154	0.144	0.15
202	Other malignant neoplasms of lymphoid and histiocytic tissue	Non-Hodgkin lymphoma	0.626	0.576	0.548	0.487	0.462	0.476	0.483	0.493	0.544
203	Multiple myeloma and immunoproliferative neoplasms	Multiple myeloma	0.207	0.24	0.303	0.338	0.393	0.347	0.363	0.363	0.306

C. Garbage code redistribution

The underlying algorithm used for garbage code redistribution in the GBD 2013 is the same as the algorithm used in the GBD 2010.²² We have, however, changed how we generate some of the proportions we use to redistribute deaths to certain causes.

The statistical analysis used to determine proportions for garbage code redistribution for ill-defined cancer sites, ill-defined external causes of injury, unspecified stroke, heart failure, hypertension, and atherosclerosis was built off of the approach outlined by Ahern et al.²³ For each redistribution package, we defined the “universe” of data as all deaths coded to either the packages’ garbage codes or the packages’ redistribution targets for each country, year, age, and sex. We then ran the following regression:

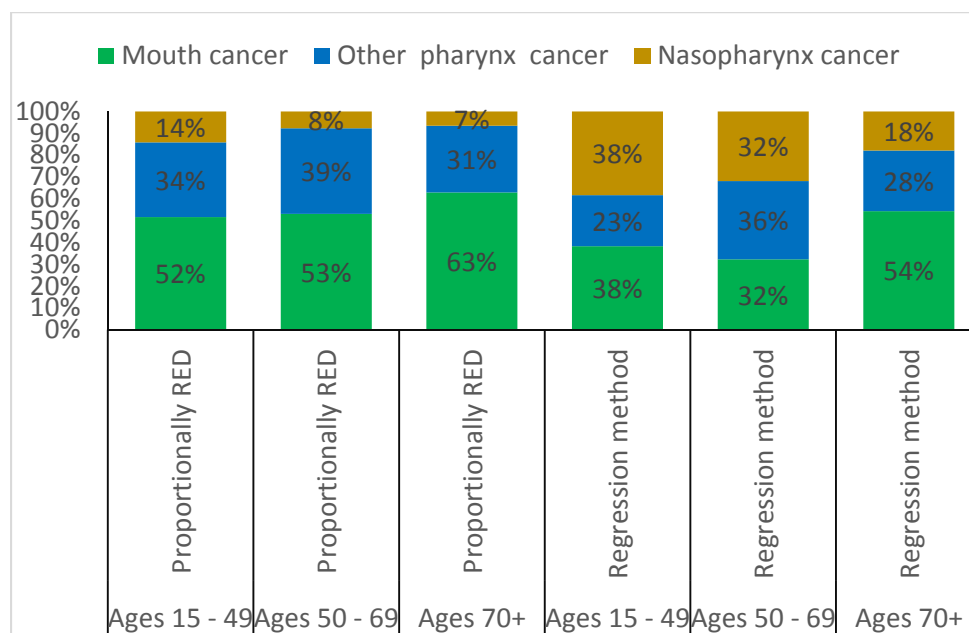

$$TG_{crt} = \alpha + \beta Gar_{crt} + \gamma_r + \theta_r Gar_{crt} + \varepsilon_{ct} \quad 24$$

Where TG_{crt} is the percentage of deaths within the given garbage code’s “universe” which were coded to a given target group, by country (c), year (t) and with countries categorized into regions (r). Gar_{crt} in this formula is the percentage of deaths within the given garbage code’s “universe” that were coded to that garbage code (by country-year, with countries grouped by region). The parameter α is a fixed constant, β is a slope coefficient describing the association between Gar and TG , γ_r is a region-specific random intercept, θ_r is a region-specific random slope and ε_{ct} is normally-distributed error. This regression was fit separately for all groups TG .

Redistribution of ICD10 code C14 and ICD9 code 149 is an example where this method was applied. The garbage codes here for malignant neoplasms of other and ill-defined sites in the lip, oral cavity and pharynx were redistributed onto mouth cancer, nasopharynx cancer, and other pharynx cancer. We combined our ICD10 and ICD9 data sources together as input data for the regression and then estimated the fraction of deaths from the garbage codes to be redistributed onto mouth, nasopharynx, and other pharynx cancers by region, sex, and age.

Figures 10 through 14 illustrated the differences of the proportional and regression-based proportions for this and other redistribution packages.

Web Figure 10: Comparisons of proportionality redistribution of C14 (or 149) on three related cancers by age in Global level

Web Figure 11: Comparisons of assigned fraction of C14 (or 149) on nasopharynx cancer by regions for all ages

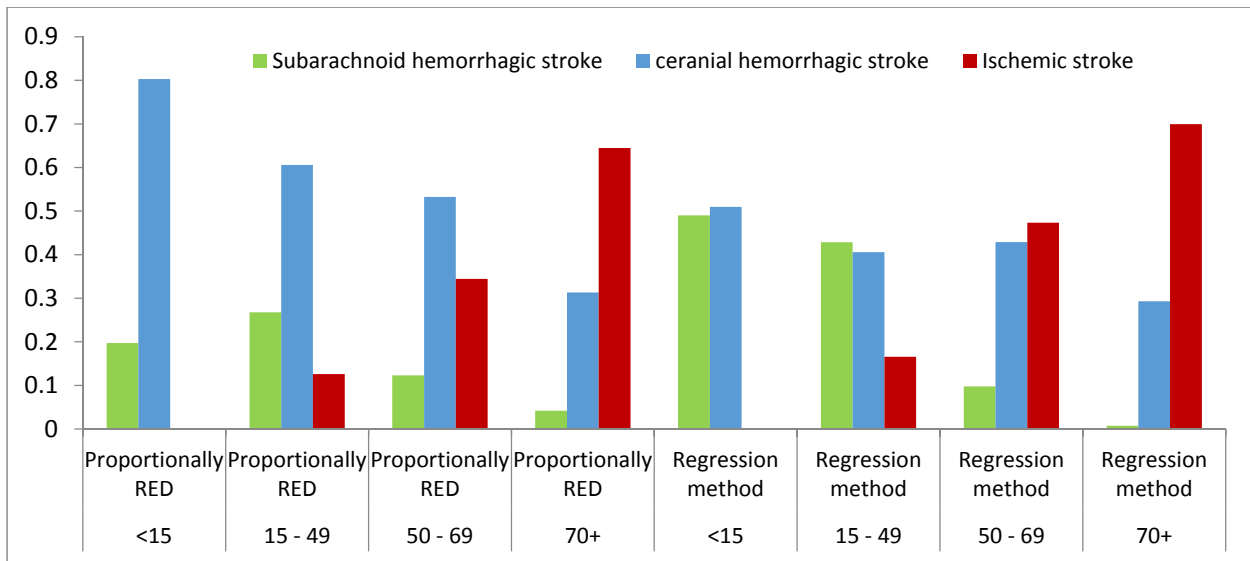

Web Figure 12: Comparisons of assigned fraction of C14 (or 149) on oral cavity and lip cancer by regions for all ages

Web Figure 13: Comparisons of assigned fraction of Y20 “Hanging, strangulation and suffocation, undetermined intent” on related injuries by ages in global level

Web Figure 14: Comparisons of assigned fraction of I64 “Stroke, not specified as hemorrhage or infarction” on related injuries by ages in global level

**Web Table 16: Cause fractions before and after redistribution at the global and super-region level for 2008
excluding studies on LRI and diarrhea etiologies**

Web Table 16a - Cause fractions before and after redistribution for global and super-region for 2008 ICD10 and ICD9 vital registration excluding studies on LRI and diarrhea etiologies

Cause	Global		Central Europe, Eastern Europe, and Central Asia		High-Income		Latin America and Caribbean

COPD = chronic obstructive pulmonary disease. *Includes birth asphyxia and birth trauma

**The differences in before redistribution between 2010 and 2013 are from change both changes in raw data numbers provided by WHO, as well as changes in mapping.

D. Age and sex splitting for the causes of death database

Different sources particularly verbal autopsy studies report deaths for a wide range of age-groups with varying intervals. For the analysis of causes of death, we map these different age intervals in the GBD standard set of age-groups. The approach taken to undertake this mapping is the same as used in the GBD 2010 Study and is explained in detail elsewhere.²²

E. Noise reduction for the causes of death database

To deal with problems of zero counts in vital registration or sibling histories for a given age-group in a given year, we use a Bayesian noise reduction algorithm. For this algorithm, we assume a normal prior and a normal data likelihood. We estimate the normal prior for a given country series of data such as vital registration, verbal autopsy, or a sequence of DHS surveys in a country by estimating a negative binomial for the fraction of deaths in each age-group due to each respective cause with dummy variables for age and year. With notable exceptions for small-island nations in Oceania and the Caribbean, these regressions are country specific so borrowing strength over age is only within a data type in a country. The variance of the prior, τ^2 , is estimated from the negative binomial regression taking into account the variance-covariance matrix of the regression coefficients. For the data variance, we use the Wilson approximation which provides an estimate of σ^2 even in cases with a zero count of cause-specific deaths. The posterior estimate for each data points is

$$\begin{aligned}\text{Mean} &= \left(\frac{\tau^2}{\tau^2 + \sigma^2} X + \frac{\sigma^2}{\tau^2 + \sigma^2} \mu \right) \\ \text{Variance} &= \left(\frac{\tau^2 \sigma^2}{\tau^2 + \sigma^2} \right)\end{aligned}\tag{25}$$

Where X is the mean of the data and μ is the mean of the prior. This approach to noise reduction avoids the problem that zero counts in an ln rates model or a logit cause fraction model will be dropped from the regression and lead to upward bias in the estimates. This is particularly important in two settings: high-income countries with small numbers of cause-specific deaths and in the analysis of sibling history data where for any given age-group in any given year the number of deaths reported in the survey that are pregnancy-related or the number of deaths from all causes in that age group may be small.

Section 6. Modelling individual causes of death

A. Strategy by cause

As noted in the main body of the paper, due to variations in data density and data quality, different strategies have been used for different causes. Web Table 19 summarizes the modeling strategy for different causes. In nearly all causes, the strategy used is similar to the GBD 2010 Study. Wherever possible, we use CODEm as the primary modeling strategy for all causes of death. Doing so enhances the comparability of results and the ensemble modeling approach has merits that are well-documented.²⁴ In conducting the GBD 2013 we identified several causes for which we have switched strategies from that used in the GBD 2010 Study. The causes for which we have used different strategies in the GBD 2013 are: HIV/AIDS; lower respiratory infections; upper respiratory infections; otitis media; meningitis; encephalitis; malaria; iron-deficiency anemia; other nutritional deficiencies; acute hepatitis A, B, and C; inguinal, femoral, and abdominal hernia; Alzheimer disease and other dementias; eating disorders; chronic kidney disease due to diabetes mellitus; chronic kidney disease due to hypertension; cellulitis; decubitus ulcer; and other skin and subcutaneous diseases. Driven by an increase in data for the specific causes themselves, we are able to attain reasonable results using CODEm for the following causes: decubitus ulcer; cellulitis; other skin disease and subcutaneous diseases; and inguinal, femoral, and abdominal hernia; otitis media; iron-deficiency anemia and other nutritional deficiencies; eating disorders; and lower respiratory infections (LRI).

In GBD 2010, otitis media, iron-deficiency anemia, and other nutritional deficiencies were estimated using negative binomial models. The GBD 2013 CODEm results for otitis media provide a better fit to the available data than the previously used negative binomial model. For deaths due to iron-deficiency anemia, CODEm produces estimates more suitable to the biological pattern of this cause; while using CODEm for other nutritional deficiencies in GBD 2013 provided more precise uncertainty intervals. Finally, using CODEm to model eating disorders in GBD 2013 resulted in estimates closer to the expected sex pattern than a negative binomial model.

In GBD 2010, we first generated the joint mortality estimates for meningitis and encephalitis in CODEm, which were then split into each cause by a fixed proportion. This approach was chosen because substantially more data points, particularly in highly endemic areas, did not distinguish between these two. In GBD 2013, we had more data that were specific to each cause that allowed us to estimate the mortality separately in CODEm (data points that did not distinguish between these two were split at the redistribution stage).

While many causes of death were shifted away from a negative binomial modeling approach, one important exception is upper respiratory infections (URI). In GBD 2010, URI deaths were modeled within an aggregate of this cause and LRI, grouped as acute respiratory infections (ARI). Deaths due to ARI were modeled using CODEm in GBD 2010, and divided into URI and LRI using a fixed proportion. In GBD 2013, grouped ARI was removed, and URI and LRI deaths were modeled separately due to better quality data, mapping, and more precise definitions. LRI deaths were modeled using CODEm in GBD 2013, however a negative binomial model was used to estimate deaths due to URI as this strategy is well suited to model low number of global deaths.

We apply the modeling strategies for malaria, tuberculosis, and HIV as described in Murray et al.²⁵

GBD 2010 analysis of deaths due to chronic kidney disease (CKD) assumed the same risk of mortality across etiologies of end-stage renal disease and applied prevalence-based etiological proportions obtained from renal replacement therapy registries to the CKD mortality estimates in order to obtain etiology-specific mortality estimates. However, literature confirms that the risk of mortality differs among renal replacement therapy patients of different etiologies.^{26–28} GBD 2013 relaxes this assumption by directly modeling etiology-specific CKD mortality data from vital registration systems for CKD due to diabetes, hypertension, and glomerulonephritis using CODEm. Because of poor data quality for CKD due to other causes, this residual etiological proportion was modeled using data from renal replacement therapy registries.

Unlike the causes of death detailed above, where CODEm was determined to provide more reasonable results, deaths due to acute viral hepatitis (including hepatitis A, B, C and E) were transitioned from CODEm to natural history models in GBD 2013. Many acute hepatitis death reports are coded nonspecifically (e.g. ICD-10 code B17.9, acute viral hepatitis, unspecified), and type-specific mortality data for acute hepatitis are therefore limited and unreliable. We, therefore, developed four natural history models – one each for hepatitis A, B, C and E – to estimate type-specific acute hepatitis mortality. The deaths estimated from these four models were then fit within the larger acute viral hepatitis mortality envelope via CodCorrect.

For cholera, we compared the expected number of cholera cases for each country-year from epidemiological studies that reported proportion of cholera in patients with diarrhoea using the total number of diarrhoea episodes from a separate analysis. We assigned cholera population attributable fractions to adjust the cholera cases. We modelled under-reporting of cholera case notification and imputed for all countries to predict the total number of cholera cases for all countries present in WHO cholera notification. Furthermore, we modelled proportion of cholera in all diarrhoea cases in these countries to impute for all country-years from 1990 onward, giving us a final estimate of the proportion of cholera and ultimately the number of cholera cases by country and year. Up until this step, country estimates were for all ages combined. To split into age-specific estimates of cholera cases, we used a common age curve derived from a random effect meta-regression analysis (DisMod-MR); the age curve was derived from studies that reported the proportion of cholera in cases for multiple age groups.

B. CODEm model performance

The majority of the causes of death, including most major causes except HIV, were modeled using cause of death ensemble modelling (CODEm). Web Table 19 provides a summary of the performance of these CODEm models in terms of the standard out-of-sample predictive validity metrics. Three metrics are reported: a) the average root-mean-squared error of the prediction compared to the data held out from the analysis across the set of different hold-outs used for a cause; b) the root-mean-squared error of the data and model prediction trend across hold-outs; and c) the data coverage of the 95% uncertainty intervals for the predicted values of the data across hold-outs. More detail on the CODEm approach to modeling is available^{22,24} Web Table 21 provides more detail for each CODEm analysis including the covariates tested and the prior belief based on the literature for the direction of the relationship between covariates and the cause-specific outcome.

Web Table 22 – CODEm covariates used, level of covariate, and expected direction of covariate by cause, sex, and age

Cause	Sex	Age Start	Age End	Covariate	Level	Direction
Cellulitis	Females	28-364 days	80+ years	Population 15 to 30 (proportion)	3	None
Cellulitis	Females	28-364 days	80+ years	Education (years per capita)	3	Negative
Cellulitis	Females	28-364 days	80+ years	Latitude Over 45 (proportion)	3	None
Cellulitis	Females	28-364 days	80+ years	Latitude 30 to 45 (proportion)	3	None
Cellulitis	Males	28-364 days	80+ years	Health System Access 2 (unitless)	1	Negative
Cellulitis	Males	28-364 days	80+ years	Improved Water Source (proportion with access)	1	Negative
Cellulitis	Males	28-364 days	80+ years	Sanitation (proportion with access)	1	Negative
Cellulitis	Males	28-364 days	80+ years	Malnutrition (proportion <2SD weight for age)	1	Positive
Cellulitis	Males	28-364 days	80+ years	Alcohol (liters per capita)	2	Positive
Cellulitis	Males	28-364 days	80+ years	Smoking Prevalence	2	Positive
Cellulitis	Males	28-364 days	80+ years	Latitude 30 to 45 (proportion)	3	None
Cellulitis	Males	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Cellulitis	Males	28-364 days	80+ years	Education (years per capita)	3	Negative
Cellulitis	Males	28-364 days	80+ years	Population 15 to 30 (proportion)	3	None
Cellulitis	Males	28-364 days	80+ years	Latitude Under 15 (proportion)	3	None
Cellulitis	Males	28-364 days	80+ years	Latitude Over 45 (proportion)	3	None
Cerebrovascular disease	Females	0-6 days	80+ years	Cumulative Cigarettes (5 Years)	1	Positive
Cerebrovascular disease	Females	0-6 days	80+ years	Smoking Prevalence	1	Positive
Cerebrovascular disease	Females	0-6 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Cerebrovascular disease	Females	0-6 days	80+ years	Fruits (kcal per capita)	2	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Nuts & Seeds (kcal per capita)	2	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	In-Milk (kcal per capita)	2	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Alcohol (liters per capita)	2	None
Cerebrovascular disease	Females	0-6 days	80+ years	PUFA Omega 3 - Seafood (kcal per capita)	2	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Vegetables (kcal per capita)	2	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	PUFA Omega 6 - Vegetable Oils (kcal per capita)	2	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	LDI (I\$ per capita)	3	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Health System Access 2 (unitless)	3	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Whole Grains (kcal per capita)	3	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Red Meat (kcal per capita)	3	Positive
Cerebrovascular disease	Females	0-6 days	80+ years	Education (years per capita)	3	Negative
Cerebrovascular disease	Females	0-6 days	80+ years	Animal Fats (kcal per capita)	3	Positive
Cerebrovascular disease	Females	0-6 days	80+ years	Pulses & Legumes (kcal per capita)	3	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Mean BMI	1	Positive
Cerebrovascular disease	Males	0-6 days	80+ years	Smoking Prevalence	1	Positive

Web Table 22 – CODEm covariates used, level of covariate, and expected direction of covariate by cause, sex, and age

Cause	Sex	Age Start	Age End	Covariate	Level	Direction
Cerebrovascular disease	Males	0-6 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Cerebrovascular disease	Males	0-6 days	80+ years	Cumulative Cigarettes (5 Years)	1	Positive
Cerebrovascular disease	Males	0-6 days	80+ years	Alcohol (liters per capita)	2	None
Cerebrovascular disease	Males	0-6 days	80+ years	Fruits (kcal per capita)	2	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Nuts & Seeds (kcal per capita)	2	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Vegetables (kcal per capita)	2	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	PUFA Omega 3 - Seafood (kcal per capita)	2	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	PUFA Omega 6 - Vegetable Oils (kcal per capita)	2	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Red Meat (kcal per capita)	3	Positive
Cerebrovascular disease	Males	0-6 days	80+ years	LDI (I\$ per capita)	3	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Pulses & Legumes (kcal per capita)	3	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Health System Access 2 (unitless)	3	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Whole Grains (kcal per capita)	3	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Education (years per capita)	3	Negative
Cerebrovascular disease	Males	0-6 days	80+ years	Animal Fats (kcal per capita)	3	Positive
Cervical cancer [Developed]	Females	15-19 years	80+ years	Smoking Prevalence	1	Positive
Cervical cancer [Developed]	Females	15-19 years	80+ years	Abortion On-Demand Illegal (binary)	1	Positive
Cervical cancer [Developed]	Females	15-19 years	80+ years	Health System Access 2 (unitless)	2	Negative
Cervical cancer [Developed]	Females	15-19 years	80+ years	Fruits (kcal per capita)	2	Negative
Cervical cancer [Developed]	Females	15-19 years	80+ years	Vegetables (kcal per capita)	2	Negative
Cervical cancer [Developed]	Females	15-19 years	80+ years	Total Fertility Rate	2	Positive
Cervical cancer [Developed]	Females	15-19 years	80+ years	Fertility (15-19 year olds)	2	Positive
Cervical cancer [Developed]	Females	15-19 years	80+ years	Education (years per capita)	3	Negative
Cervical cancer [Developed]	Females	15-19 years	80+ years	LDI (I\$ per capita)	3	Negative
Cervical cancer [Developing]	Females	15-19 years	80+ years	Abortion On-Demand Illegal (binary)	1	Positive
Cervical cancer [Developing]	Females	15-19 years	80+ years	Smoking Prevalence	1	Positive
Cervical cancer [Developing]	Females	15-19 years	80+ years	Health System Access 2 (unitless)	2	Negative
Cervical cancer [Developing]	Females	15-19 years	80+ years	Fruits (kcal per capita)	2	Negative
Cervical cancer [Developing]	Females	15-19 years	80+ years	Fertility (15-19 year olds)	2	Positive
Cervical cancer [Developing]	Females	15-19 years	80+ years	Education (years per capita)	3	Negative
Chagas disease	Females	28-364 days	80+ years	Chagas Population-at-Risk 2 (proportion)	1	Positive
Chagas disease	Females	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chagas disease	Females	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chagas disease	Females	28-364 days	80+ years	Education (years per capita)	3	None
Chagas disease	Males	28-364 days	80+ years	Chagas Population-at-Risk 2 (proportion)	1	Positive

Web Table 22 – CODEm covariates used, level of covariate, and expected direction of covariate by cause, sex, and age

Cause	Sex	Age Start	Age End	Covariate	Level	Direction
Chagas disease	Males	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chagas disease	Males	28-364 days	80+ years	Education (years per capita)	3	None
Chagas disease	Males	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chromosomal unbalanced rearrangements	Females	0-6 days	80+ years	Rate of congenital chromosomal abnormalities (per 1000 live births)	1	Positive
Chromosomal unbalanced rearrangements	Females	0-6 days	80+ years	Live Births 40+ (proportion)	1	Positive
Chromosomal unbalanced rearrangements	Females	0-6 days	80+ years	Live Births 35+ (proportion)	1	Positive
Chromosomal unbalanced rearrangements	Females	0-6 days	80+ years	Alcohol (liters per capita)	3	Positive
Chromosomal unbalanced rearrangements	Females	0-6 days	80+ years	Indoor Air Pollution (All Cooking Fuels)	3	Positive
Chromosomal unbalanced rearrangements	Males	0-6 days	80+ years	Live Births 40+ (proportion)	1	Positive
Chromosomal unbalanced rearrangements	Males	0-6 days	80+ years	Rate of congenital chromosomal abnormalities (per 1000 live births)	1	Positive
Chromosomal unbalanced rearrangements	Males	0-6 days	80+ years	Live Births 35+ (proportion)	1	Positive
Chromosomal unbalanced rearrangements	Males	0-6 days	80+ years	Indoor Air Pollution (All Cooking Fuels)	3	Positive
Chronic kidney disease	Females	28-364 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Chronic kidney disease	Females	28-364 days	80+ years	Mean BMI	1	Positive
Chronic kidney disease	Females	28-364 days	80+ years	Diabetes Age-Standardized Prevalence (proportion)	1	Positive
Chronic kidney disease	Females	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chronic kidney disease	Females	28-364 days	80+ years	Diabetes Fasting Plasma Glucose (mmol/L)	1	Positive
Chronic kidney disease	Females	28-364 days	80+ years	Red Meat (kcal per capita)	2	None
Chronic kidney disease	Females	28-364 days	80+ years	Total Calories (kcal per capita)	2	Positive
Chronic kidney disease	Females	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease	Females	28-364 days	80+ years	Animal Fats (kcal per capita)	2	None
Chronic kidney disease	Females	28-364 days	80+ years	Cholesterol (total, mean per capita)	2	Positive
Chronic kidney disease	Females	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic kidney disease	Females	28-364 days	80+ years	Education (years per capita)	3	Negative
Chronic kidney disease	Males	28-364 days	80+ years	Mean BMI	1	Positive
Chronic kidney disease	Males	28-364 days	80+ years	Diabetes Age-Standardized Prevalence (proportion)	1	Positive
Chronic kidney disease	Males	28-364 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Chronic kidney disease	Males	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chronic kidney disease	Males	28-364 days	80+ years	Diabetes Fasting Plasma Glucose (mmol/L)	1	Positive
Chronic kidney disease	Males	28-364 days	80+ years	Animal Fats (kcal per capita)	2	None
Chronic kidney disease	Males	28-364 days	80+ years	Total Calories (kcal per capita)	2	Positive
Chronic kidney disease	Males	28-364 days	80+ years	Red Meat (kcal per capita)	2	None
Chronic kidney disease	Males	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease	Males	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic kidney disease	Males	28-364 days	80+ years	Education (years per capita)	3	Negative

Web Table 22 – CODEm covariates used, level of covariate, and expected direction of covariate by cause, sex, and age

Cause	Sex	Age Start	Age End	Covariate	Level	Direction
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Diabetes Fasting Plasma Glucose (mmol/L)	1	Positive
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Diabetes Age-Specific Prevalence (proportion)	1	Positive
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Red Meat (kcal per capita)	2	None
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Cholesterol (total, mean per capita)	2	Positive
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Total Calories (kcal per capita)	2	Positive
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Mean BMI	2	Positive
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	Animal Fats (kcal per capita)	2	None
Chronic kidney disease due to diabetes mellitus	Females	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Diabetes Age-Specific Prevalence (proportion)	1	Positive
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Diabetes Fasting Plasma Glucose (mmol/L)	1	Positive
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Mean BMI	2	Positive
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Cholesterol (total, mean per capita)	2	Positive
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Red Meat (kcal per capita)	2	None
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Animal Fats (kcal per capita)	2	None
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Total Calories (kcal per capita)	2	Positive
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	Education (years per capita)	3	Negative
Chronic kidney disease due to diabetes mellitus	Males	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic kidney disease due to glomerulonephritis	Females	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chronic kidney disease due to glomerulonephritis	Females	28-364 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Chronic kidney disease due to glomerulonephritis	Females	28-364 days	80+ years	Animal Fats (kcal per capita)	2	Positive
Chronic kidney disease due to glomerulonephritis	Females	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease due to glomerulonephritis	Females	28-364 days	80+ years	Cholesterol (total, mean per capita)	2	Positive
Chronic kidney disease due to glomerulonephritis	Females	28-364 days	80+ years	Education (years per capita)	3	Negative
Chronic kidney disease due to glomerulonephritis	Males	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chronic kidney disease due to glomerulonephritis	Males	28-364 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Chronic kidney disease due to glomerulonephritis	Males	28-364 days	80+ years	Animal Fats (kcal per capita)	2	Positive
Chronic kidney disease due to glomerulonephritis	Males	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease due to glomerulonephritis	Males	28-364 days	80+ years	Education (years per capita)	3	Negative
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Mean BMI	2	Positive
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Red Meat (kcal per capita)	2	None

Web Table 22 – CODEm covariates used, level of covariate, and expected direction of covariate by cause, sex, and age

Cause	Sex	Age Start	Age End	Covariate	Level	Direction
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Total Calories (kcal per capita)	2	Positive
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Cholesterol (total, mean per capita)	2	Positive
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Animal Fats (kcal per capita)	2	None
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic kidney disease due to hypertension	Females	28-364 days	80+ years	Education (years per capita)	3	Negative
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Health System Access (unitless)	1	Negative
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Systolic Blood Pressure (mmHg)	1	Positive
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Animal Fats (kcal per capita)	2	None
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Red Meat (kcal per capita)	2	None
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Whole Grains (kcal per capita)	2	None
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Mean BMI	2	Positive
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Total Calories (kcal per capita)	2	Positive
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Cholesterol (total, mean per capita)	2	Positive
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	Education (years per capita)	3	Negative
Chronic kidney disease due to hypertension	Males	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Cumulative Cigarettes (5 Years)	1	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Indoor Air Pollution (Biomass Cooking)	1	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Smoking Prevalence	1	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Indoor Air Pollution (Coal Cooking)	1	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Outdoor Air Pollution (PM2.5)	1	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Health System Access 2 (unitless)	1	Negative
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Elevation Over 1500m (proportion)	2	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Population Density (over 1000 ppl/sqkm, proportion)	2	Positive
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	LDI (I\$ per capita)	3	Negative
Chronic obstructive pulmonary disease	Females	28-364 days	80+ years	Education (years per capita)	3	Negative

Web Table 23 - Comparison of covariates used in CoD models for GBD 2010 and GBD 2013

Cause Name	Sex	Covariate name	GBD 2010			GBD 2013		
			Level 1	Level 2	Level 3	Level 1	Level 2	Level 3
Protein-energy malnutrition	1	Improved Water Source (proportion with access)				X		
Protein-energy malnutrition	1	LDI (I\$ per capita)			X*			X
Protein-energy malnutrition	1	Education (years per capita)			X*			X
Protein-energy malnutrition	2	Improved Water Source (proportion with access, based on GBD 2010 definition)		X*				
Protein-energy malnutrition	2	Health System Access 2 (unitless)	X*			X		
Protein-energy malnutrition	2	Malnutrition (proportion <2SD weight for age)	X*			X		
Protein-energy malnutrition	2	Malnutrition Shock (binary)	X*			X		
Protein-energy malnutrition	2	Age-Standardize Prevalence of Severe Anemia				X		
Protein-energy malnutrition	2	Rainfall Quintile 1 (proportion)		X*			X	
Protein-energy malnutrition	2	Rainfall Quintile 2 (proportion)		X*			X	
Protein-energy malnutrition	2	Sanitation (proportion with access)		X*			X	
Protein-energy malnutrition	2	Total Calories (kcal per capita)	X*				X	
Protein-energy malnutrition	2	Mortality Rate Due to War Shocks (per 1 person)		X*			X	
Protein-energy malnutrition	2	Improved Water Source (proportion with access)					X	
Protein-energy malnutrition	2	LDI (I\$ per capita)			X*			X
Protein-energy malnutrition	2	Education (years per capita)			X*			X
Iodine deficiency	1	LDI (I\$ per capita)		X*	X*			
Iodine deficiency	1	Health System Access 2 (unitless)	X*					
Iodine deficiency	1	Proportion of households using iodized salt (adjusted)				X*		
Iodine deficiency	1	Malnutrition (proportion <2SD weight for age)	X*	X*				
Iodine deficiency	1	Mortality Rate Due to Conflict in Last 10 Years (per 1 person)		X*				
Iodine deficiency	2	LDI (I\$ per capita)		X*	X*			
Iodine deficiency	2	Health System Access 2 (unitless)	X*					
Iodine deficiency	2	Proportion of households using iodized salt (adjusted)				X*		
Iodine deficiency	2	Malnutrition (proportion <2SD weight for age)	X*	X*				
Iodine deficiency	2	Mortality Rate Due to Conflict in Last 10 Years (per 1 person)		X*				
Iron-deficiency anemia	1	Year				X*		
Iron-deficiency anemia	1	Health System Access 2 (unitless)	X*			X		
Iron-deficiency anemia	1	Malnutrition (proportion <2SD weight for age)	X*			X		
Iron-deficiency anemia	1	Malnutrition Shock (binary)	X*			X		
Iron-deficiency anemia	1	Age-Standardize Prevalence of Severe Anemia	X*			X		
Iron-deficiency anemia	1	Rainfall Quintile 1 (proportion)		X*			X	
Iron-deficiency anemia	1	Rainfall Quintile 2 (proportion)		X*			X	
Iron-deficiency anemia	1	Sanitation (proportion with access)		X*			X	
Iron-deficiency anemia	1	Total Calories (kcal per capita)		X*			X	
Iron-deficiency anemia	1	Mortality Rate Due to War Shocks (per 1 person)		X*			X	
Iron-deficiency anemia	1	Improved Water Source (proportion with access)		X*			X	
Iron-deficiency anemia	1	LDI (I\$ per capita)			X*			X

Section 7. CoDCorrect algorithm

The CoDCorrect algorithm used in the GBD 2013 is the same as the algorithm used in the GBD 2010²², with some modifications described in the main text of the paper. Updated percentage changes before and after CoDCorrect for level 1 causes are below.

Web Table 24: Percent change for level 1 CoDCorrect causes

Web Table 24 — Percent change for level 1 CoDCorrect causes in 2013

Cause	% Change
Tuberculosis	6.91
HIV/AIDS	-6.95
Diarrheal diseases	5.08
Typhoid fever	7.67
Paratyphoid fever	7.80
Other intestinal infectious diseases	8.73
Lower respiratory infections	2.91
Upper respiratory infections	6.90
Otitis media	5.35
Meningitis	8.54
Encephalitis	6.01
Diphtheria	5.60
Whooping cough	0.04
Tetanus	2.80
Measles	-5.66
Varicella and herpes zoster	3.78
Malaria	-1.25
Chagas disease	-6.66
Visceral leishmaniasis	5.11
African trypanosomiasis	17.02
Schistosomiasis	6.24
Cysticercosis	5.16
Cystic echinococcosis	4.22
Dengue	8.29
Yellow fever	11.40
Rabies	7.12
Intestinal nematode infections	7.37
Other neglected tropical diseases	8.17
Maternal disorders	4.92
Neonatal disorders	1.96
Nutritional deficiencies	6.62
Sexually transmitted diseases excluding HIV	5.91
Hepatitis	5.66
Other infectious diseases	6.10
Esophageal cancer	-0.61
Stomach cancer	-1.90
Liver cancer	-0.62
Larynx cancer	-0.50
Tracheal, bronchus, and lung cancers	-3.05
Breast cancer	-1.83
Cervical cancer	3.13
Uterine cancer	-2.72
Prostate cancer	-5.15
Colon and rectum cancer	-3.36
Lip and oral cavity cancer	1.49
Nasopharynx cancer	0.40
Other pharynx cancer	1.78
Gallbladder and biliary tract cancer	-2.06
Pancreatic cancer	-4.08

Web Table 24 — Percent change for level 1 CoDCorrect causes in 2013

Cause	% Change
Malignant skin melanoma	-3.84
Non-melanoma skin cancer	-3.20
Ovarian cancer	-1.63
Testicular cancer	2.59
Kidney cancer	-3.55
Bladder cancer	-3.06
Brain and nervous system cancer	-1.59
Thyroid cancer	-1.12
Mesothelioma	-4.00
Hodgkin lymphoma	1.06
Non-Hodgkin lymphoma	-1.14
Multiple myeloma	-3.77
Leukemia	-0.94
Other neoplasms	-0.62
Cardiovascular diseases	-1.27
Chronic respiratory diseases	0.81
Cirrhosis	1.99
Digestive diseases	2.43
Alzheimer disease and other dementias	-5.54
Parkinson disease	-6.19
Epilepsy	4.19
Multiple sclerosis	-3.17
Other neurological disorders	-1.77
Schizophrenia	-1.54
Alcohol use disorders	-0.93
Drug use disorders	1.19
Eating disorders	0.79
Diabetes mellitus	0.95
Acute glomerulonephritis	3.28
Chronic kidney disease	-0.29
Urinary diseases and male infertility	0.63
Gynecological diseases	5.99
Hemoglobinopathies and hemolytic anemias	-2.71
Endocrine, metabolic, blood, and immune disorders	0.60
Musculoskeletal disorders	-0.23
Congenital anomalies	2.47
Skin and subcutaneous diseases	3.24
Sudden infant death syndrome	-2.11
Transport injuries	3.89
Falls	0.20
Drowning	3.04
Fire, heat, and hot substances	6.89
Poisonings	4.16
Unintentional firearm injuries	7.54
Unintentional suffocation	-1.75
Other exposure to mechanical forces	3.17
Adverse effects of medical treatment	2.64
Animal contact	7.29
Pulmonary aspiration and foreign body in airway	-0.05

Web Table 24 — Percent change for level 1 CoDCorrect causes in 2013

Cause	% Change
Foreign body in other body part	5.33
Other unintentional injuries	6.49
Self-harm	2.56
Interpersonal violence	3.62

Section 8. Measures of inequality and Multiple decrement life table

8.1. Gini coefficients

This section presents technical details on evaluating inequality of certain metrics such as Under-5 Mortality rate or cause specific mortality rate at the country level.

There are two types of gini coefficient in measuring inequality we have used in this study: population weighted gini coefficient, and population weighted mean absolute difference.

The population weighted gini coefficient is computed using the equation below:

$$Gini = \frac{\sum_{i=1}^N \sum_{j=1}^N (|x_i - x_j|) p_i p_j}{2(\sum_{j=1}^N p_j)^2 \mu}$$

Where x_i is the metric of interest for country i , p_i is the population of country i , N is the number of countries, and μ is the mean across countries. Inspection of this equation shows that this can be interpreted as the average relative difference across all pairs of countries weighted for population size.²⁹

and the population weighted mean absolute difference is computed using the following equation:

$$\text{mean absolute difference} = \frac{\sum_{i=1}^N \sum_{j=1}^N (|x_i - x_j|) p_i p_j}{2(\sum_{j=1}^N p_j)^2}$$

Where p_i and p_j represent national populations covered in the GBD2013 study. x_i and x_j indicate age-specific mortality rates for age groups 0, -14, 5-9, ..., and 80 plus.

8.2. Multiple decrement life-tables

Multiple decrement life tables are widely used by demographers to examine the impacts of cause specific mortality on summary mortality indicators such as probability of death and life expectancy. For our purposes, we calculated the proportion probability of death for a specific age group that is attributable to a specific cause of death. This metric can be obtained using the following equation:

$${}_n QF_x^i = \frac{\sum_{x=X}^{N+X-5} l_x \cdot {}_5q_x^i}{\sum_{i=1}^K \sum_{x=X}^{N+X-5} l_x \cdot {}_5q_x^i}$$

Where ${}_n QF_x^i$ is the fraction of contribution to probability of death from cause i in age group x to $x+n$. l_x is the probability of survival from birth to age x and ${}_5q_x^i$ is the probability of death from cause i in age group x to $x+5$.

Section 9. Supplemental and detailed results for causes of death

This section presents detailed results on death numbers, death rates, and YLLs for 1990 and 2013. The tables are arranged as follows:

Web Table 25: Global deaths by age, sex, and cause in 1990

Web Table 25 - Global deaths with 95% UI by age, sex, and cause in 1990

Cause	Both Sexes, All Ages	Both Sexes, 0-4 Years	Both Sexes, 5-14 Years	Both Sexes, 15-49 Years	Both Sexes, 50-69 Years	Both Sexes, 70-80 Years
All causes	47,468,690 (46,771,664 - 48,223,315)	12,115,239 (11,935,353 - 12,293,205)	1,369,657 (1,345,522 - 1,395,802)	7,348,011 (7,135,193 - 7,590,054)	11,038,553 (10,744,932 - 11,339,632)	15,597,231 (15,405,476 - 15,811,822)
Communicable, maternal, neonatal, and nutritional diseases	16,149,409 (15,674,491 - 16,597,585)	10,076,305 (9,698,809 - 10,366,453)	717,109 (679,553 - 757,949)	2,153,637 (2,061,121 - 2,263,635)	1,547,827 (1,476,303 - 1,643,579)	1,654,532 (1,572,809 - 1,737,573)
HIV/AIDS and tuberculosis	2,072,463 (1,938,187 - 2,246,131)	125,658 (111,654 - 166,599)	44,329 (40,045 - 50,744)	843,183 (772,069 - 922,707)	690,590 (638,124 - 753,722)	368,703 (334,836 - 397,546)

Road injuries	774,188 (727,207 - 858,399)	63,026 (50,990 - 80,336)	61,038 (55,498 - 68,570)	480,965 (452,693 - 527,025)	122,000 (112,449 - 135,850)	47,159 (44,551 - 52,603)
Pedestrian road injuries	275,267 (225,916 - 347,156)	34,219 (25,159 - 47,793)	31,913 (26,492 - 39,494)	135,115 (107,153 - 173,893)	50,404 (41,381 - 62,246)	23,616 (20,190 - 29,219)
Cyclist road injuries	48,316 (39,556 - 59,089)	3,462 (2,389 - 4,853)	5,769 (4,652 - 7,425)	23,857 (18,965 - 29,276)	10,272 (8,124 - 12,723)	4,955 (3,986 - 6,038)
Motorcyclist road injuries	160,908 (132,231 - 194,871)	5,538 (3,590 - 8,320)	5,220 (3,726 - 7,104)	129,851 (106,274 - 156,562)	16,147 (12,287 - 20,560)	4,153 (3,104 - 5,169)
Motor vehicle road injuries	264,285 (229,811 - 304,445)	16,922 (11,848 - 22,826)	15,217 (12,169 - 18,808)	179,086 (157,184 - 205,460)	40,000 (33,393 - 46,120)	13,060 (10,813 - 15,402)
Other road injuries	25,411 (13,738 - 34,691)	2,885 (1,043 - 4,912)	2,919 (1,360 - 4,421)	13,056 (7,027 - 19,714)	5,178 (2,778 - 7,781)	1,375 (810 - 2,033)
Other transport injuries	64,444 (52,054 - 73,706)	7,980 (5,701 - 10,746)	4,561 (3,651 - 5,536)	35,240 (28,640 - 41,349)	12,209 (9,147 - 14,354)	4,454 (3,023 - 5,362)
Unintentional injuries	1,193,663 (1,088,741 - 1,295,838)	333,364 (251,198 - 396,943)	132,912 (114,570 - 146,458)	432,180 (398,221 - 477,733)	176,547 (163,057 - 199,043)	118,661 (109,878 - 137,783)
Falls	198,498 (174,962 - 252,735)	22,231 (15,394 - 31,960)	10,809 (8,948 - 13,760)	68,605 (58,069 - 86,696)	46,041 (40,582 - 59,084)	50,812 (45,177 - 64,345)
Drowning	356,505 (269,403 - 424,027)	124,340 (74,735 - 166,471)	74,517 (54,475 - 88,051)	119,254 (96,750 - 142,165)	28,117 (23,086 - 34,916)	10,277 (8,447 - 12,955)
Fire, heat, and hot substances	116,066 (93,417 - 137,279)	32,129 (21,381 - 42,705)	8,535 (6,789 - 10,473)	45,342 (35,197 - 53,996)	18,051 (15,143 - 23,220)	12,008 (9,538 - 14,425)
Poisonings	73,988 (61,165 - 108,722)	15,920 (10,870 - 27,843)	4,241 (3,363 - 6,592)	36,310 (27,870 - 49,227)	12,493 (10,255 - 18,421)	5,024 (4,343 - 7,984)
Exposure to mechanical forces	165,173 (142,164 - 193,198)	58,867 (31,152 - 83,013)	11,375 (9,663 - 14,258)	68,097 (61,134 - 84,114)	11,375 (18,775 - 25,955)	5,412 (4,712 - 6,527)
Unintentional firearm injuries	39,684 (33,273 - 46,446)	4,920 (3,629 - 6,812)	2,832 (2,192 - 3,634)	24,474 (19,968 - 30,045)	5,505 (4,109 - 7,734)	1,953 (1,385 - 2,681)
Unintentional suffocation	48,525 (14,291 - 72,721)	42,618 (10,160 - 66,016)	1,486 (775 - 2,266)	2,863 (1,689 - 3,628)	1,058 (624 - 1,331)	501 (297 - 650)
Other exposure to mechanical forces	76,964 (70,219 - 96,772)	11,330 (7,412 - 16,624)	7,058 (5,762 - 9,462)	40,760 (36,934 - 49,379)	14,858 (13,010 - 18,102)	2,958 (2,616 - 3,703)
Adverse effects of medical treatment	49,589 (35,361 - 63,110)	16,732 (9,474 - 25,127)	2,114 (1,336 - 2,765)	10,724 (7,522 - 13,894)	10,013 (7,402 - 12,966)	10,006 (7,416 - 13,244)
Animal contact	50,936 (31,054 - 61,113)	7,836 (4,757 - 12,014)	10,445 (6,599 - 13,383)	18,842 (10,482 - 23,481)	10,128 (6,143 - 12,597)	3,684 (2,226 - 4,605)
Venomous animal contact	39,283 (23,410 - 48,275)	4,358 (2,678 - 7,633)	8,390 (5,101 - 10,729)	15,708 (8,471 - 19,772)	8,259 (5,013 - 10,578)	2,568 (1,485 - 3,277)
Non-venomous animal contact	11,653 (6,690 - 14,811)	3,478 (1,618 - 5,495)	2,055 (1,218 - 3,073)	3,134 (1,537 - 3,894)	1,870 (1,127 - 2,362)	1,116 (694 - 1,476)
Foreign body	82,438 (50,626 - 140,338)	41,683 (23,667 - 77,366)	2,618 (1,617 - 4,627)	12,168 (7,093 - 18,635)	10,882 (6,157 - 17,006)	15,087 (8,984 - 25,859)
Pulmonary aspiration and foreign body in airway	80,829 (49,188 - 138,742)	41,190 (23,363 - 77,038)	2,488 (1,515 - 4,469)	11,741 (6,760 - 18,244)	10,446 (5,805 - 16,560)	14,963 (8,885 - 25,760)
Foreign body in other body part	1,609 (868 - 2,467)	492 (211 - 1,058)	130 (73 - 222)	427 (239 - 611)	436 (236 - 619)	124 (67 - 176)
Other unintentional injuries	100,471 (89,991 - 112,114)	13,626 (10,115 - 16,441)	8,257 (6,602 - 9,450)	52,838 (46,991 - 60,741)	19,400 (17,249 - 22,173)	6,350 (5,557 - 7,265)
Self-harm and interpersonal violence	701,076 (589,113 - 796,293)	12,432 (7,701 - 16,921)	13,271 (10,157 - 15,889)	483,879 (408,000 - 547,525)	138,191 (114,564 - 159,917)	53,303 (42,335 - 60,248)
Self-harm	433,377 (351,866 - 483,739)	--	5,694 (4,250 - 6,967)	274,921 (224,004 - 305,139)	106,044 (87,846 - 123,731)	46,718 (35,716 - 53,173)
Interpersonal violence	267,699 (182,762 - 343,595)	12,432 (7,701 - 16,921)	7,577 (4,814 - 10,069)	208,958 (145,232 - 261,073)	32,147 (20,468 - 44,203)	6,586 (4,076 - 9,240)
Assault by firearm	111,721 (76,133 - 148,789)	1,576 (706 - 2,550)	1,864 (1,046 - 2,607)	94,184 (65,786 - 122,976)	12,277 (6,997 - 18,202)	1,821 (978 - 2,884)
Assault by sharp object	73,748 (46,996 - 110,042)	1,418 (487 - 2,516)	1,351 (648 - 1,956)	60,084 (38,684 - 89,554)	9,471 (5,499 - 14,342)	1,424 (798 - 2,283)
Assault by other means	82,229 (49,778 - 104,887)	9,438 (5,920 - 13,441)	4,362 (2,714 - 6,022)	54,690 (31,429 - 69,588)	10,399 (6,127 - 14,707)	3,340 (1,945 - 4,696)
Forces of nature, war, and legal intervention	64,710 (42,929 - 126,548)	9,957 (9,342 - 11,520)	5,337 (3,619 - 10,559)	29,701 (17,527 - 64,786)	16,246 (9,623 - 34,125)	3,468 (2,036 - 6,961)
Exposure to forces of nature	20,767 (10,581 - 46,514)	2,543 (2,273 - 2,717)	1,677 (893 - 3,748)	9,045 (3,919 - 22,268)	6,053 (2,708 - 14,137)	1,450 (627 - 3,135)
Collective violence and legal intervention	43,943 (30,410 - 77,955)	7,414 (6,923 - 9,026)	3,661 (2,578 - 6,436)	20,656 (12,753 - 40,832)	10,193 (6,424 - 19,398)	2,019 (1,237 - 3,716)

Web Table 25 - Global deaths with 95% UI by age, sex, and cause in 1990

Cause	Females, All Ages	Females, 0-4 Years	Females, 5-14 Years	Females, 15-49 Years	Females, 50-69 Years	Females, 70-80 Years
All causes	22,352,850 (21,883,157 - 22,924,556)	5,729,740 (5,538,313 - 5,938,918)	656,205 (633,092 - 681,224)	2,981,359 (2,851,101 - 3,120,562)	4,470,148 (4,309,244 - 4,667,206)	8,515,398 (8,381,927 - 8,697,565)
Communicable, maternal, neonatal, and nutritional diseases	7,828,654 (7,560,760 - 8,132,028)	4,784,499 (4,570,016 - 5,017,268)	374,156 (353,891 - 396,442)	1,134,022 (1,079,146 - 1,198,585)	657,889 (616,394 - 700,344)	878,088 (809,102 - 941,296)
HIV/AIDS and tuberculosis	811,889 (736,563 - 902,280)	65,053 (57,442 - 88,079)	25,244 (21,947 - 30,519)	325,346 (290,865 - 367,057)	246,740 (215,682 - 275,521)	149,505 (128,085 - 167,455)
Tuberculosis	730,271 (653,810 - 818,605)	47,601 (40,545 - 69,727)	24,401 (21,154 - 29,599)	273,414 (241,435 - 312,844)	236,658 (205,473 - 265,158)	148,197 (126,900 - 166,284)
HIV/AIDS	81,617 (64,392 - 105,855)	17,453 (15,976 - 18,993)	843 (651 - 1,020)	51,932 (38,793 - 72,755)	10,081 (7,491 - 13,612)	1,308 (958 - 1,751)
HIV/AIDS resulting in mycobacterial infection	6,575 (4,767 - 8,905)	1,405 (1,127 - 1,731)	63 (46 - 84)	4,162 (2,859 - 5,985)	835 (576 - 1,171)	110 (75 - 154)
HIV/AIDS resulting in other diseases	75,042 (59,044 - 97,633)	16,048 (14,695 - 17,489)	780 (604 - 943)	47,770 (35,530 - 66,871)	9,246 (6,859 - 12,497)	1,198 (880 - 1,602)
Diarrhea, lower respiratory, and other common infectious diseases	3,946,426 (3,738,043 - 4,224,381)	2,501,772 (2,332,835 - 2,731,202)	247,653 (225,826 - 271,346)	293,569 (264,678 - 325,424)	297,519 (271,455 - 329,546)	605,913 (543,005 - 660,288)
Diarrheal diseases	1,335,023 (1,233,114 - 1,438,159)	788,901 (702,757 - 882,875)	80,304 (69,347 - 92,883)	119,236 (106,745 - 131,018)	146,877 (127,682 - 164,866)	199,704 (176,050 - 223,829)
Intestinal infectious diseases	119,973 (66,456 - 197,906)	38,323 (21,536 - 64,130)	36,376 (20,353 - 59,572)	36,790 (19,218 - 62,719)	5,866 (3,205 - 9,968)	2,619 (1,589 - 4,199)
Typhoid fever	84,181 (43,942 - 143,456)	24,959 (12,732 - 43,124)	26,467 (14,272 - 43,952)	26,843 (13,434 - 46,692)	4,150 (2,054 - 7,284)	1,762 (953 - 2,947)
Paratyphoid fever	29,506 (15,515 - 50,841)	9,993 (4,991 - 18,005)	9,266 (4,803 - 16,578)	8,534 (4,249 - 15,339)	1,202 (598 - 2,196)	512 (277 - 913)
Other intestinal infectious diseases	6,286 (5,568 - 7,101)	3,370 (2,861 - 3,962)	643 (537 - 776)	1,413 (1,241 - 1,592)	515 (431 - 605)	345 (290 - 401)
Lower respiratory infections	1,707,999 (1,585,500 - 1,845,126)	1,068,574 (967,937 - 1,172,453)	62,726 (53,731 - 72,130)	81,433 (72,011 - 91,494)	112,854 (99,358 - 130,158)	382,412 (327,978 - 425,064)
Upper respiratory infections	2,234 (1,760 - 3,006)	845 (527 - 1,546)	109 (55 - 222)	407 (295 - 596)	413 (279 - 649)	460 (328 - 651)
Otitis media	2,737 (2,487 - 3,007)	1,083 (916 - 1,290)	370 (324 - 431)	563 (500 - 634)	383 (340 - 434)	337 (293 - 387)
Meningitis	215,011 (189,028 - 245,286)	135,303 (112,858 - 163,907)	21,764 (18,286 - 25,203)	30,525 (26,066 - 35,027)	16,733 (13,918 - 19,188)	10,687 (8,445 - 12,073)
Pneumococcal meningitis	52,372 (45,645 - 60,042)	27,932 (22,807 - 35,116)	6,883 (5,382 - 8,405)	9,439 (7,815 - 11,412)	4,921 (3,760 - 6,481)	3,197 (2,465 - 3,893)
H influenzae type B meningitis	54,808 (46,326 - 65,715)	43,033 (35,296 - 53,341)	5,183 (4,091 - 6,332)	3,958 (3,202 - 4,882)	1,616 (1,276 - 2,042)	1,019 (782 - 1,224)
Meningococcal meningitis	39,703 (34,634 - 45,708)	23,701 (19,723 - 29,541)	3,792 (3,128 - 4,740)	6,381 (5,319 - 7,697)	3,400 (2,659 - 4,130)	2,429 (1,854 - 2,927)
Other meningitis	68,128 (59,215 - 78,486)	40,636 (33,401 - 48,981)	5,907 (4,706 - 7,279)	10,747 (8,895 - 12,870)	6,796 (5,161 - 8,379)	4,042 (3,132 - 4,897)
Encephalitis	45,608 (29,804 - 60,278)	25,591 (13,549 - 37,366)	6,479 (3,343 - 9,683)	7,772 (4,885 - 10,157)	3,907 (2,545 - 4,963)	1,859 (1,168 - 2,277)
Diphtheria	4,028 (1,550 - 11,471)	3,193 (911 - 10,574)	612 (162 - 2,258)	175 (84 - 386)	48 (17 - 144)	--
Whooping cough	75,044 (29,193 - 158,952)	70,384 (27,448 - 148,808)	3,877 (1,453 - 8,617)	691 (281 - 1,642)	92 (39 - 214)	--

Foreign body	59,807 (36,038 - 89,939)	34,619 (18,347 - 55,419)	1,131 (671 - 1,752)	4,225 (2,693 - 6,376)	4,379 (2,742 - 6,340)	15,452 (9,403 - 23,429)
Pulmonary aspiration and foreign body in airway	58,922 (35,168 - 89,101)	34,370 (17,998 - 55,173)	1,051 (595 - 1,680)	4,039 (2,515 - 6,151)	4,291 (2,664 - 6,260)	15,171 (9,138 - 23,182)
Foreign body in other body part	885 (590 - 1,385)	249 (131 - 566)	80 (51 - 135)	186 (126 - 277)	88 (60 - 111)	282 (191 - 377)
Other unintentional injuries	47,601 (24,351 - 54,665)	12,544 (6,263 - 15,846)	4,515 (2,696 - 5,518)	10,370 (5,838 - 12,046)	10,952 (4,927 - 13,408)	9,221 (4,083 - 11,559)
Self-harm and interpersonal violence	351,678 (304,733 - 389,599)	11,169 (7,952 - 15,437)	11,293 (9,336 - 13,401)	218,049 (189,642 - 244,382)	69,605 (58,517 - 77,849)	41,563 (33,508 - 46,295)
Self-harm	278,645 (238,894 - 312,409)	--	6,071 (4,896 - 7,455)	175,286 (152,411 - 198,549)	60,258 (49,910 - 67,900)	37,030 (28,390 - 41,329)
Interpersonal violence	73,033 (53,432 - 92,239)	11,169 (7,952 - 15,437)	5,222 (3,909 - 7,022)	42,763 (30,626 - 53,214)	9,347 (6,572 - 11,882)	4,532 (3,168 - 5,675)
Assault by firearm	15,897 (10,011 - 21,886)	1,520 (755 - 2,307)	918 (552 - 1,341)	11,025 (7,131 - 14,837)	1,725 (986 - 2,497)	710 (401 - 1,105)
Assault by sharp object	20,229 (12,271 - 26,016)	1,604 (654 - 2,580)	1,017 (493 - 1,436)	14,027 (8,696 - 18,003)	2,541 (1,514 - 3,342)	1,039 (575 - 1,428)
Assault by other means	36,907 (27,314 - 51,198)	8,045 (5,832 - 11,690)	3,286 (2,529 - 4,793)	17,712 (12,933 - 24,663)	5,080 (3,540 - 6,830)	2,783 (1,901 - 3,645)
Forces of nature, war, and legal intervention	41,139 (28,328 - 76,506)	8,733 (8,143 - 10,378)	3,274 (2,348 - 5,874)	16,404 (9,791 - 34,959)	9,734 (5,696 - 20,265)	2,993 (1,736 - 6,142)
Exposure to forces of nature	12,655 (7,042 - 26,344)	2,302 (2,059 - 2,473)	971 (564 - 2,040)	4,519 (1,982 - 10,762)	3,575 (1,628 - 8,351)	1,287 (581 - 2,847)
Collective violence and legal intervention	28,484 (20,493 - 49,607)	6,431 (5,966 - 7,942)	2,304 (1,727 - 3,968)	11,885 (7,429 - 24,070)	6,159 (3,854 - 11,981)	1,706 (1,075 - 3,224)

Web Table 26: Global deaths by age, sex, and cause in 2013

Web Table 26 - Global deaths with 95% UI by age, sex, and cause in 2013

Cause	Both Sexes, All Ages	Both Sexes, 0-4 Years	Both Sexes, 5-14 Years	Both Sexes, 15-49 Years	Both Sexes, 50-69 Years	Both Sexes, 70-80 Years
All causes	54,863,765 (53,576,131 - 56,333,554)	6,279,920 (5,984,416 - 6,608,273)	842,217 (807,043 - 881,489)	8,644,753 (8,310,903 - 9,047,821)	13,985,351 (13,431,633 - 14,613,908)	25,111,525 (24,649,089 - 25,556,462)
Communicable, maternal, neonatal, and nutritional diseases	11,809,640 (11,335,529 - 12,282,964)	5,041,672 (4,727,671 - 5,364,619)	425,388 (394,724 - 458,703)	2,580,398 (2,467,374 - 2,715,489)	1,567,943 (1,474,814 - 1,672,232)	2,194,239 (2,018,278 - 2,324,200)
HIV/AIDS and tuberculosis	2,631,235 (2,497,349 - 2,863,173)	106,721 (95,461 - 117,867)	83,245 (78,588 - 88,298)	1,418,038 (1,335,837 - 1,544,424)	689,363 (633,564 - 761,002)	333,867 (304,589 - 366,763)
Tuberculosis	1,290,261 (1,167,284 - 1,406,184)	42,886 (31,283 - 51,691)	16,944 (13,157 - 19,633)	483,659 (426,825 - 538,448)	440,876 (392,938 - 491,757)	305,896 (275,807 - 337,272)
HIV/AIDS	1,340,974 (1,257,838 - 1,482,611)	63,835 (58,494 - 71,634)	66,302 (62,189 - 71,162)	934,379 (862,473 - 1,041,389)	248,487 (227,153 - 286,742)	27,971 (24,975 - 32,982)
HIV/AIDS resulting in mycobacterial infection	84,012 (67,367 - 104,862)	3,773 (3,041 - 4,688)	3,643 (2,959 - 4,469)	58,334 (46,723 - 73,193)	16,341 (12,980 - 20,654)	1,921 (1,504 - 2,459)
HIV/AIDS resulting in other diseases	1,256,962 (1,178,071 - 1,391,067)	60,062 (54,737 - 67,324)	62,659 (58,600 - 67,383)	876,045 (806,494 - 977,480)	232,146 (212,444 - 265,996)	26,050 (23,237 - 30,782)
Diarrhea, lower respiratory, and other common infectious diseases	4,750,530 (4,388,833 - 5,029,893)	1,829,945 (1,657,159 - 2,018,020)	221,807 (195,000 - 253,121)	552,013 (499,272 - 620,281)	631,380 (554,741 - 691,731)	1,515,385 (1,343,902 - 1,628,160)
Diarrheal diseases	1,264,079 (1,151,183 - 1,383,210)	519,666 (438,795 - 593,675)	55,512 (46,311 - 66,508)	151,081 (136,494 - 168,030)	200,842 (170,808 - 238,799)	336,979 (289,059 - 395,752)
Intestinal infectious diseases	221,256 (122,575 - 362,580)	62,419 (32,994 - 103,607)	60,113 (34,559 - 93,822)	81,627 (42,990 - 138,783)	12,502 (6,428 - 21,997)	4,595 (2,638 - 7,511)
Typhoid fever	160,721 (85,914 - 268,021)	43,047 (21,680 - 73,256)	44,429 (25,168 - 70,399)	60,553 (31,727 - 105,676)	9,337 (4,520 - 16,688)	3,356 (1,789 - 5,708)
Paratyphoid fever	54,283 (29,257 - 92,018)	16,210 (8,255 - 27,920)	15,106 (8,284 - 24,834)	19,487 (9,969 - 34,963)	2,617 (1,222 - 5,005)	864 (434 - 1,568)
Other intestinal infectious diseases	6,251 (5,541 - 6,997)	3,162 (2,663 - 3,718)	579 (471 - 711)	1,587 (1,392 - 1,801)	548 (474 - 634)	375 (323 - 438)
Lower respiratory infections	2,652,629 (2,368,032 - 2,808,097)	905,059 (810,304 - 998,125)	55,971 (47,734 - 65,170)	211,934 (182,185 - 232,793)	351,515 (286,707 - 384,055)	1,128,150 (975,062 - 1,217,515)
Upper respiratory infections	3,930 (3,336 - 4,706)	828 (666 - 1,230)	116 (69 - 188)	944 (736 - 1,235)	984 (691 - 1,450)	1,058 (785 - 1,461)
Otitis media	2,417 (2,273 - 2,562)	470 (402 - 545)	203 (179 - 231)	611 (565 - 660)	496 (458 - 537)	637 (595 - 685)
Meningitis	303,477 (261,412 - 346,349)	141,952 (105,060 - 182,518)	23,125 (18,922 - 27,350)	71,333 (59,735 - 80,130)	40,543 (32,440 - 46,531)	26,524 (21,943 - 30,029)
Pneumococcal meningitis	79,079 (67,773 - 91,091)	30,488 (21,886 - 39,411)	7,384 (5,948 - 8,933)	21,647 (17,858 - 25,129)	11,886 (9,232 - 14,530)	7,673 (6,258 - 9,159)
H influenzae type B meningitis	64,410 (53,043 - 76,437)	44,116 (32,887 - 56,130)	5,126 (4,178 - 6,103)	8,550 (6,997 - 9,916)	4,033 (3,031 - 5,084)	2,585 (2,031 - 3,068)
Meningococcal meningitis	65,742 (55,894 - 75,828)	29,549 (21,753 - 38,571)	5,231 (4,218 - 6,418)	16,230 (13,455 - 18,303)	8,646 (6,541 - 10,190)	6,086 (4,817 - 7,026)
Other meningitis	94,246 (82,203 - 106,417)	37,800 (27,834 - 48,068)	5,383 (4,302 - 6,358)	24,906 (20,990 - 28,664)	15,977 (13,228 - 19,077)	10,179 (8,369 - 12,214)
Encephalitis	77,320 (65,438 - 97,016)	25,792 (18,995 - 35,540)	9,231 (6,979 - 12,374)	21,894 (17,576 - 28,555)	13,083 (10,563 - 17,510)	7,320 (5,590 - 9,081)
Diphtheria	3,276 (1,695 - 6,588)	2,120 (827 - 5,310)	587 (181 - 1,721)	431 (204 - 908)	139 (44 - 441)	--
Whooping cough	60,635 (22,294 - 136,765)	56,420 (20,746 - 126,996)	3,266 (1,110 - 8,271)	829 (342 - 1,974)	120 (56 - 275)	--
Tetanus	58,879 (39,802 - 77,349)	31,503 (16,746 - 45,010)	1,955 (1,511 - 2,725)	7,804 (6,040 - 10,784)	10,349 (6,631 - 16,034)	7,267 (4,460 - 11,612)
Measles	95,597 (48,499 - 172,868)	82,100 (41,723 - 144,973)	11,350 (5,502 - 21,878)	2,083 (922 - 4,998)	63 (28 - 150)	--
Varicella and herpes zoster	7,036 (5,735 - 8,684)	1,616 (1,075 - 2,531)	379 (239 - 634)	1,441 (1,104 - 1,945)	743 (539 - 1,082)	2,857 (1,969 - 4,204)
Neglected tropical diseases and malaria	996,985 (840,475 - 1,185,195)	622,695 (486,651 - 795,714)	75,088 (62,898 - 91,270)	155,079 (135,000 - 182,703)	86,609 (70,880 - 105,855)	57,513 (46,999 - 73,355)
Malaria	854,600 (702,924 - 1,032,497)	586,844 (451,969 - 756,864)	51,916 (40,475 - 67,441)	107,867 (88,267 - 135,794)	64,466 (50,731 - 82,218)	43,507 (33,682 - 55,867)
Chagas disease	10,611 (4,158 - 32,997)	9 (3 - 28)	14 (4 - 38)	1,358 (512 - 4,671)	4,571 (1,633 - 14,037)	4,659 (1,671 - 15,518)
Leishmaniasis	62,471 (52,291 - 73,297)	21,221 (16,529 - 26,896)	12,985 (9,791 - 16,357)	22,367 (18,526 - 26,663)	4,551 (3,700 - 5,493)	1,348 (1,122 - 1,560)
Visceral leishmaniasis	62,471 (52,291 - 73,297)	21,221 (16,529 - 26,896)	12,985 (9,791 - 16,357)	22,367 (18,526 - 26,663)	4,551 (3,700 - 5,493)	1,348 (1,122 - 1,560)
African trypanosomiasis	6,887 (3,669 - 10,873)	471 (226 - 797)	789 (378 - 1,267)	4,463 (2,386 - 7,092)	965 (511 - 1,521)	199 (106 - 311)
Schistosomiasis	5,509 (4,907 - 6,179)	78 (56 - 107)	143 (112 - 183)	2,195 (1,901 - 2,523)	1,991 (1,736 - 2,277)	1,103 (971 - 1,262)
Cysticercosis	664 (536 - 951)	26 (15 - 49)	30 (20 - 50)	395 (317 - 573)	157 (130 - 211)	56 (48 - 71)
Cystic echinococcosis	2,225 (2,105 - 2,357)	161 (136 - 188)	245 (220 - 274)	935 (871 - 1,002)	530 (496 - 568)	354 (336 - 374)
Dengue	9,110 (5,630 - 10,842)	2,617 (1,368 - 3,488)	2,279 (1,106 - 2,930)	2,591 (1,827 - 3,039)	902 (682 - 1,013)	722 (529 - 828)
Yellow fever	513 (431 - 612)	49 (32 - 75)	105 (71 - 157)	283 (229 - 355)	56 (40 - 79)	21 (13 - 34)
Rabies	23,542 (17,273 - 28,560)	2,538 (1,743 - 3,745)	5,029 (3,450 - 6,705)	8,403 (6,061 - 10,263)	5,714 (4,243 - 7,114)	1,858 (1,307 - 2,333)
Intestinal nematode infections	4,508 (3,969 - 5,106)	3,087 (2,614 - 3,636)	601 (499 - 711)	381 (316 - 455)	213 (168 - 269)	226 (178 - 281)

Web Table 26 - Global deaths with 95% UI by age, sex, and cause in 2013

Cause	Both Sexes, All Ages	Both Sexes, 0-4 Years	Both Sexes, 5-14 Years	Both Sexes, 15-49 Years	Both Sexes, 50-69 Years	Both Sexes, 70-80 Years

Exposure to forces of nature	19,195 (13,481 - 31,978)	1,501 (448 - 9,000)	527 (377 - 795)	7,012 (4,900 - 11,080)	6,849 (4,936 - 10,330)	3,305 (2,637 - 4,437)
Collective violence and legal intervention	31,228 (20,330 - 56,973)	3,518 (3,504 - 3,539)	1,514 (1,056 - 2,708)	12,242 (6,925 - 26,092)	9,868 (6,065 - 18,181)	4,086 (2,534 - 6,394)

Web Table 26 - Global deaths with 95% UI by age, sex, and cause in 2013

Cause	Males, All Ages	Males, 0-4 Years	Males, 5-14 Years	Males, 15-49 Years	Males, 50-69 Years	Males, 70-80 Years
All causes	29,918,793 (28,727,254 - 31,104,340)	3,383,342 (3,202,127 - 3,573,200)	459,136 (438,093 - 483,662)	5,422,787 (5,119,361 - 5,767,143)	8,669,517 (8,151,057 - 9,187,527)	11,984,010 (11,564,351 - 12,314,481)
Communicable, maternal, neonatal, and nutritional diseases	6,226,550 (5,929,853 - 6,532,136)	2,723,272 (2,516,478 - 2,912,825)	215,932 (196,091 - 237,128)	1,295,247 (1,204,188 - 1,398,981)	941,870 (866,138 - 1,021,788)	1,050,230 (933,382 - 1,132,886)
HIV/AIDS and tuberculosis	1,558,726 (1,447,085 - 1,768,058)	56,015 (49,370 - 63,007)	41,846 (39,213 - 44,629)	803,952 (743,310 - 910,233)	451,712 (405,537 - 522,015)	205,201 (183,667 - 235,690)
Tuberculosis	835,602 (739,281 - 958,088)	23,249 (16,159 - 29,303)	8,187 (6,410 - 9,922)	312,575 (271,741 - 357,782)	303,721 (262,038 - 354,328)	187,669 (166,714 - 215,720)
HIV/AIDS	723,124 (670,708 - 831,754)	32,766 (30,103 - 36,807)	33,659 (31,571 - 36,067)	491,376 (448,911 - 563,085)	147,990 (133,660 - 176,719)	17,332 (15,244 - 21,018)
HIV/AIDS resulting in mycobacterial infection	50,780 (40,801 - 63,789)	2,175 (1,756 - 2,707)	2,074 (1,690 - 2,535)	34,448 (27,459 - 43,640)	10,775 (8,553 - 13,821)	1,307 (1,019 - 1,690)
HIV/AIDS resulting in other diseases	672,344 (623,472 - 777,275)	30,591 (27,923 - 34,395)	31,585 (29,548 - 33,940)	456,928 (415,558 - 526,838)	137,215 (124,002 - 162,858)	16,025 (14,079 - 19,446)
Diarrhea, lower respiratory, and other common infectious diseases	2,427,634 (2,203,550 - 2,611,622)	949,210 (838,354 - 1,064,027)	114,964 (98,347 - 134,710)	314,780 (276,099 - 361,435)	355,950 (302,315 - 400,657)	692,730 (592,432 - 762,685)
Diarrheal diseases	607,696 (535,804 - 683,957)	271,385 (217,055 - 330,639)	27,857 (21,586 - 35,097)	78,180 (67,497 - 89,698)	97,150 (77,479 - 123,209)	133,123 (109,891 - 161,159)
Intestinal infectious diseases	117,978 (63,879 - 195,741)	32,439 (17,159 - 55,485)	32,767 (18,298 - 52,105)	44,433 (22,052 - 79,506)	6,337 (2,989 - 11,992)	2,000 (1,104 - 3,555)
Typhoid fever	84,910 (44,412 - 143,185)	22,036 (11,027 - 38,407)	24,011 (13,010 - 38,932)	32,766 (15,840 - 58,976)	4,673 (2,060 - 9,062)	1,424 (706 - 2,650)
Paratyphoid fever	29,397 (15,032 - 49,675)	8,531 (4,168 - 15,135)	8,414 (4,328 - 14,311)	10,710 (5,040 - 19,656)	1,355 (533 - 3,003)	386 (174 - 756)
Other intestinal infectious diseases	3,670 (3,212 - 4,174)	1,872 (1,529 - 2,250)	342 (272 - 428)	957 (821 - 1,095)	309 (259 - 366)	190 (156 - 230)
Lower respiratory infections	1,380,227 (1,187,697 - 1,486,807)	470,154 (407,791 - 530,874)	28,736 (23,582 - 35,093)	130,371 (106,759 - 149,201)	215,140 (167,692 - 242,615)	535,826 (437,177 - 597,993)
Upper respiratory infections	2,160 (1,747 - 2,800)	432 (267 - 709)	61 (33 - 122)	580 (416 - 853)	588 (386 - 976)	499 (344 - 788)
Otitis media	1,215 (1,121 - 1,318)	232 (192 - 280)	106 (89 - 126)	357 (322 - 397)	250 (225 - 278)	271 (245 - 300)
Meningitis	162,570 (129,112 - 198,636)	75,201 (44,676 - 106,548)	12,201 (9,645 - 15,360)	41,027 (34,040 - 47,977)	22,230 (17,781 - 27,047)	11,911 (9,736 - 14,322)
Pneumococcal meningitis	42,235 (34,273 - 51,507)	16,023 (9,407 - 23,419)	3,913 (2,991 - 5,111)	12,514 (10,243 - 14,937)	6,417 (4,834 - 8,406)	3,368 (2,596 - 4,330)
H influenzae type B meningitis	34,692 (24,472 - 44,813)	23,600 (13,966 - 33,401)	2,704 (2,129 - 3,443)	4,936 (3,912 - 5,930)	2,264 (1,675 - 3,094)	1,187 (908 - 1,544)
Meningococcal meningitis	34,638 (27,901 - 43,396)	15,635 (9,154 - 23,668)	2,833 (2,139 - 3,671)	8,908 (7,203 - 10,586)	4,603 (3,374 - 6,030)	2,660 (2,101 - 3,351)
Other meningitis	51,005 (41,041 - 61,194)	19,943 (11,913 - 28,243)	2,753 (2,174 - 3,401)	14,669 (11,824 - 17,932)	8,946 (7,022 - 11,509)	4,696 (3,409 - 5,975)
Encephalitis	39,683 (31,419 - 52,658)	12,149 (7,493 - 18,857)	4,737 (3,354 - 6,858)	12,283 (8,688 - 16,954)	6,848 (5,134 - 10,136)	3,667 (2,433 - 4,973)
Diphtheria	1,684 (714 - 4,051)	1,035 (298 - 3,311)	302 (70 - 1,099)	265 (103 - 696)	83 (22 - 345)	--
Whooping cough	28,036 (10,193 - 63,883)	26,139 (9,511 - 59,106)	1,421 (488 - 3,633)	417 (172 - 1,023)	59 (28 - 137)	--
Tetanus	35,184 (21,667 - 49,230)	17,757 (8,806 - 26,639)	1,089 (785 - 1,812)	5,192 (3,515 - 7,914)	6,873 (3,523 - 12,245)	4,274 (2,021 - 8,376)
Measles	47,920 (24,075 - 88,366)	41,467 (20,979 - 75,178)	5,496 (2,639 - 11,103)	922 (401 - 2,218)	36 (16 - 83)	--
Varicella and herpes zoster	3,280 (2,519 - 4,317)	822 (482 - 1,459)	190 (104 - 372)	752 (516 - 1,159)	357 (230 - 612)	1,159 (723 - 2,000)
Neglected tropical diseases and malaria	518,487 (418,667 - 651,428)	328,598 (248,293 - 440,664)	36,719 (29,072 - 49,581)	84,497 (69,202 - 108,251)	43,790 (33,486 - 57,857)	24,883 (18,347 - 34,300)
Malaria	434,816 (337,340 - 564,670)	308,276 (228,861 - 419,140)	23,063 (16,024 - 36,081)	55,239 (39,773 - 78,196)	30,596 (21,021 - 42,239)	17,642 (11,709 - 25,323)
Chagas disease	6,427 (1,351 - 21,902)	5 (1 - 19)	8 (1 - 22)	957 (222 - 3,758)	2,994 (575 - 10,619)	2,463 (464 - 8,764)
Leishmaniasis	39,520 (32,640 - 47,431)	12,956 (9,283 - 17,319)	7,862 (5,814 - 10,174)	14,840 (11,672 - 18,678)	2,986 (2,314 - 3,764)	876 (700 - 1,057)
Visceral leishmaniasis	39,520 (32,640 - 47,431)	12,956 (9,283 - 17,319)	7,862 (5,814 - 10,174)	14,840 (11,672 - 18,678)	2,986 (2,314 - 3,764)	876 (700 - 1,057)
African trypanosomiasis	3,616 (1,898 - 5,712)	241 (108 - 433)	402 (182 - 657)	2,441 (1,255 - 3,862)	448 (236 - 712)	84 (45 - 133)
Schistosomiasis	3,206 (2,825 - 3,624)	43 (29 - 64)	82 (62 - 110)	1,349 (1,159 - 1,575)	1,176 (1,005 - 1,363)	556 (472 - 649)
Cysticercosis	332 (272 - 458)	11 (7 - 22)	14 (9 - 23)	207 (169 - 288)	77 (65 - 100)	22 (19 - 28)
Cystic echinococcosis	1,089 (1,018 - 1,172)	69 (57 - 84)	109 (98 - 123)	494 (456 - 538)	275 (255 - 300)	142 (132 - 151)
Dengue	4,433 (2,515 - 5,340)	1,442 (659 - 2,044)	1,033 (493 - 1,285)	1,136 (745 - 1,331)	483 (336 - 560)	339 (201 - 388)
Yellow fever	361 (288 - 454)	34 (20 - 56)	73 (44 - 122)	203 (155 - 274)	38 (25 - 58)	14 (8 - 26)
Rabies	14,119 (8,603 - 18,327)	1,399 (815 - 2,290)	3,260 (1,843 - 4,722)	5,209 (3,214 - 6,892)	3,310 (1,982 - 4,447)	941 (523 - 1,300)
Intestinal nematode infections	2,235 (1,885 - 2,643)	1,489 (1,192 - 1,845)	300 (233 - 373)	225 (174 - 283)	119 (85 - 159)	102 (72 - 136)

Web Table 26 - Global deaths with 95% UI by age, sex, and cause in 2013

Cause	Males, All Ages	Males, 0-4 Years	Males, 5-14 Years	Males, 15-49 Years	Males, 50-69 Years	Males, 70-80 Years
Ascariasis	2,235 (1,885 - 2,643)	1,489 (1,192 - 1,845)	300 (233 - 373)	225 (174 - 283)	119 (85 - 159)	102 (72 - 136)
Other neglected tropical diseases	8,334 (6,842 - 10,727)	2,632 (1,787 - 4,178)	513 (386 - 719)	2,199 (1,770 - 2,881)	1,288 (1,021 - 1,622)	1,703 (1,351 - 2,188)

Injuries	3,240,621 (2,995,150 - 3,476,560)	202,059 (172,293 - 242,734)	132,430 (119,035 - 149,044)	1,735,088 (1,598,276 - 1,871,968)	714,126 (642,982 - 779,757)	456,917 (404,557 - 488,650)
Transport injuries	1,102,598 (991,431 - 1,206,245)	41,951 (33,212 - 53,705)	45,871 (39,610 - 52,097)	668,127 (605,197 - 731,933)	237,451 (207,587 - 265,373)	109,198 (94,533 - 119,110)
Road injuries	1,038,739 (929,465 - 1,131,794)	38,265 (30,068 - 49,656)	42,983 (37,343 - 48,854)	631,134 (573,555 - 690,861)	222,971 (195,213 - 249,178)	103,386 (89,447 - 112,833)
Pedestrian road injuries	376,422 (295,955 - 460,302)	19,986 (14,517 - 28,563)	21,573 (16,895 - 26,155)	181,688 (139,454 - 229,147)	96,867 (74,947 - 117,618)	56,308 (45,663 - 66,284)
Cyclist road injuries	69,878 (54,797 - 84,861)	2,249 (1,499 - 3,367)	3,981 (3,096 - 5,362)	32,815 (25,609 - 40,038)	19,782 (14,815 - 24,948)	11,051 (8,446 - 13,611)
Motorcyclist road injuries	214,886 (167,263 - 259,730)	2,884 (1,844 - 4,383)	3,638 (2,552 - 5,029)	168,350 (133,126 - 203,177)	31,521 (22,792 - 40,244)	8,494 (6,199 - 11,068)
Motor vehicle road injuries	362,661 (307,078 - 422,517)	11,913 (8,642 - 15,681)	12,407 (9,689 - 15,587)	241,515 (205,765 - 277,774)	70,532 (58,062 - 84,293)	26,294 (21,216 - 31,952)
Other road injuries	14,894 (10,170 - 20,702)	1,234 (627 - 1,877)	1,385 (872 - 2,140)	6,766 (4,524 - 9,192)	4,270 (2,977 - 6,616)	1,239 (864 - 1,823)
Other transport injuries	63,859 (49,873 - 73,491)	3,686 (2,557 - 4,767)	2,888 (2,081 - 3,500)	36,994 (29,191 - 43,182)	14,480 (11,287 - 17,241)	5,812 (4,271 - 6,872)
Unintentional injuries	1,205,736 (1,088,237 - 1,329,009)	151,687 (126,630 - 185,600)	75,604 (66,142 - 90,631)	464,617 (421,633 - 524,051)	260,201 (228,853 - 287,566)	253,627 (208,713 - 278,712)
Falls	322,329 (248,409 - 360,399)	14,545 (10,734 - 19,471)	8,626 (6,519 - 11,079)	94,249 (75,219 - 110,743)	82,952 (61,546 - 96,023)	121,957 (89,392 - 138,689)
Drowning	254,288 (207,297 - 342,435)	47,112 (34,821 - 65,857)	37,614 (30,589 - 51,164)	115,823 (95,619 - 154,293)	36,219 (27,729 - 50,364)	17,520 (12,826 - 21,855)
Fire, heat, and hot substances	100,416 (80,914 - 119,634)	15,002 (11,120 - 20,308)	4,344 (3,391 - 5,662)	42,690 (34,070 - 53,220)	21,212 (16,901 - 25,631)	17,168 (13,273 - 20,102)
Poisonings	62,537 (37,606 - 73,162)	6,032 (3,705 - 8,354)	2,117 (1,154 - 2,657)	31,251 (19,256 - 38,301)	14,701 (8,411 - 17,373)	8,436 (4,614 - 9,843)
Exposure to mechanical forces	145,772 (129,293 - 176,742)	20,656 (15,707 - 39,479)	7,225 (5,800 - 10,073)	75,701 (66,689 - 87,190)	31,138 (26,225 - 35,747)	11,052 (8,534 - 12,469)
Unintentional firearm injuries	35,989 (29,656 - 43,433)	1,804 (1,245 - 2,626)	1,211 (921 - 1,552)	24,140 (19,546 - 30,277)	6,010 (4,580 - 8,003)	2,825 (2,009 - 3,805)
Unintentional suffocation	24,126 (18,346 - 59,252)	12,499 (8,327 - 32,733)	1,529 (933 - 3,819)	5,722 (4,369 - 12,430)	2,635 (2,081 - 4,691)	1,742 (1,312 - 2,628)
Other exposure to mechanical forces	85,656 (72,340 - 94,535)	6,353 (4,528 - 8,272)	4,486 (3,591 - 5,432)	45,839 (39,611 - 51,603)	22,493 (17,969 - 26,062)	6,485 (4,713 - 7,283)
Adverse effects of medical treatment	72,127 (50,238 - 89,829)	13,418 (8,034 - 21,485)	1,889 (1,183 - 2,778)	16,113 (11,499 - 20,562)	18,267 (12,573 - 22,615)	22,441 (15,138 - 27,577)
Animal contact	46,166 (36,543 - 73,955)	4,810 (2,825 - 7,501)	5,667 (3,927 - 8,678)	18,454 (13,699 - 31,583)	11,808 (8,698 - 18,993)	5,428 (4,177 - 8,431)
Venomous animal contact	33,256 (25,541 - 54,653)	2,645 (1,566 - 4,550)	4,048 (2,679 - 6,300)	14,392 (10,261 - 25,933)	8,887 (6,231 - 15,000)	3,285 (2,378 - 5,133)
Non-venomous animal contact	12,910 (9,243 - 17,878)	2,164 (1,148 - 3,604)	1,619 (1,082 - 2,548)	4,063 (2,785 - 5,611)	2,921 (2,136 - 4,239)	2,143 (1,542 - 3,026)
Foreign body	90,296 (50,448 - 129,921)	24,105 (13,570 - 37,680)	1,866 (1,167 - 2,959)	14,859 (8,220 - 21,022)	15,600 (8,108 - 22,257)	33,866 (18,370 - 51,118)
Pulmonary aspiration and foreign body in airway	88,134 (48,247 - 127,318)	23,754 (13,193 - 37,157)	1,725 (1,008 - 2,794)	14,265 (7,478 - 20,344)	14,797 (7,377 - 21,249)	33,593 (18,117 - 50,819)
Foreign body in other body part	2,161 (1,372 - 3,671)	351 (207 - 640)	141 (93 - 263)	594 (388 - 1,011)	803 (494 - 1,330)	272 (158 - 425)
Other unintentional injuries	111,806 (100,782 - 125,638)	6,008 (4,830 - 7,488)	6,256 (5,329 - 7,399)	55,477 (49,743 - 62,541)	28,304 (23,545 - 34,347)	15,761 (13,104 - 19,122)
Self-harm and interpersonal violence	904,581 (726,056 - 1,029,664)	5,605 (3,425 - 7,809)	9,761 (6,964 - 12,407)	590,331 (465,599 - 678,369)	207,414 (159,419 - 242,250)	91,470 (74,252 - 109,010)
Self-harm	574,556 (433,414 - 656,150)	--	4,723 (3,071 - 6,609)	333,309 (247,657 - 384,410)	158,508 (117,614 - 184,013)	78,015 (62,972 - 95,707)
Interpersonal violence	330,025 (226,148 - 422,217)	5,605 (3,425 - 7,809)	5,037 (3,118 - 6,732)	257,021 (178,866 - 320,168)	48,906 (32,598 - 71,780)	13,455 (7,602 - 18,683)
Assault by firearm	161,342 (103,551 - 211,854)	1,104 (562 - 1,756)	1,852 (988 - 2,638)	132,917 (86,328 - 169,544)	21,127 (13,273 - 33,183)	4,342 (2,054 - 6,947)
Assault by sharp object	90,649 (53,402 - 137,269)	797 (424 - 1,372)	884 (497 - 1,472)	71,270 (42,757 - 106,893)	14,717 (8,084 - 23,226)	2,981 (1,496 - 4,847)
Assault by other means	78,035 (49,093 - 109,283)	3,705 (2,189 - 5,236)	2,302 (1,363 - 3,311)	52,834 (33,623 - 75,039)	13,062 (7,992 - 19,579)	6,133 (3,250 - 8,576)
Forces of nature, war, and legal intervention	27,706 (16,393 - 61,113)	2,816 (2,096 - 7,012)	1,195 (777 - 2,523)	12,013 (6,518 - 27,416)	9,060 (5,203 - 18,932)	2,621 (1,474 - 5,274)
Exposure to forces of nature	8,490 (4,739 - 16,974)	839 (214 - 4,971)	274 (171 - 504)	3,749 (2,185 - 7,485)	2,940 (1,671 - 5,967)	688 (369 - 1,425)
Collective violence and legal intervention	19,215 (11,119 - 42,435)	1,977 (1,842 - 2,080)	921 (584 - 2,041)	8,264 (4,086 - 20,948)	6,120 (3,299 - 13,491)	1,933 (1,036 - 3,845)

Web Table 26 - Global deaths with 95% UI by age, sex, and cause in 2013

Cause	Females, All Ages	Females, 0-4 Years	Females, 5-14 Years	Females, 15-49 Years	Females, 50-69 Years	Females, 70-80 Years
All causes	24,944,972 (24,188,666 - 25,682,795)	2,896,578 (2,738,432 - 3,071,744)	383,081 (362,372 - 403,445)	3,221,965 (3,058,874 - 3,390,093)	5,315,834 (5,022,440 - 5,598,757)	13,127,515 (12,826,273 - 13,402,304)
Communicable, maternal, neonatal, and nutritional diseases	5,583,089 (5,329,236 - 5,834,185)	2,318,400 (2,163,129 - 2,473,840)	209,456 (192,732 - 227,107)	1,285,151 (1,216,706 - 1,359,111)	626,073 (576,610 - 680,274)	1,144,009 (1,024,610 - 1,251,583)
HIV/AIDS and tuberculosis	1,072,509 (985,546 - 1,159,303)	50,706 (44,538 - 57,255)	41,399 (38,855 - 44,310)	614,086 (570,444 - 667,741)	237,652 (210,946 - 264,327)	128,666 (105,140 - 146,624)
Tuberculosis	454,659 (356,953 - 511,449)	19,637 (13,149 - 24,602)	8,757 (6,434 - 10,753)	171,083 (136,160 - 200,693)	137,155 (112,151 - 158,194)	118,027 (92,660 - 135,613)
HIV/AIDS	617,850 (570,414 - 677,695)	31,069 (28,460 - 34,777)	32,642 (30,595 - 35,072)	443,003 (406,766 - 491,138)	100,497 (88,499 - 115,015)	10,639 (8,730 - 12,981)
HIV/AIDS resulting in mycobacterial infection	33,232 (26,745 - 41,826)	1,598 (1,281 - 1,986)	1,568 (1,280 - 1,921)	23,886 (19,201 - 30,080)	5,566 (4,293 - 7,128)	614 (457 - 798)
HIV/AIDS resulting in other diseases	584,618 (539,186 - 641,034)	29,471 (26,851 - 32,944)	31,074 (29,062 - 33,444)	419,117 (383,757 - 466,593)	94,931 (84,049 - 109,490)	10,025 (8,211 - 12,297)
Diarrhea, lower respiratory, and other common infectious diseases	2,322,897 (2,135,458 - 2,483,165)	880,735 (791,785 - 971,477)	106,844 (93,521 - 121,865)	237,233 (207,359 - 271,520)	275,430 (237,880 - 315,560)	822,655 (715,191 - 914,589)
Diarrheal diseases	656,384 (576,321 - 746,032)	248,281 (201,429 - 300,930)	27,655 (21,382 - 35,161)	72,900 (63,078 - 83,898)	103,692 (82,189 - 133,973)	203,855 (164,103 - 255,906)
Intestinal infectious diseases	103,278 (55,773 - 170,765)	29,980 (16,047 - 50,306)	27,346 (15,651 - 43,493)	37,194 (19,176 - 64,138)	6,165 (3,038 - 11,056)	2,594 (1,402 - 4,353)
Typhoid fever	75,812 (40,055 - 126,410)	21,011 (10,638 - 35,631)	20,418 (11,338 - 32,861)	27,788 (13,807 - 48,706)	4,664 (2,203 - 6,634)	1,932 (960 - 3,348)
Paratyphoid fever	24,886 (13,120 - 42,628)	7,679 (3,884 - 13,503)	6,692 (3,665 - 11,501)	8,777 (4,125 - 15,988)	1,261 (535 - 2,542)	477 (223 - 941)
Other intestinal infectious diseases	2,581 (2,263 - 2,912)	1,290 (1,070 - 1,533)	236 (184 - 300)	629 (536 - 731)	239 (197 - 291)	185 (149 - 225)
Lower respiratory infections	1,272,401 (1,133,102 - 1,371,222)	434,905 (379,168 - 493,847)	27,235 (21,791 - 32,717)	81,562 (68,769 - 91,658)	136,375 (109,446 - 152,920)	592,324 (498,068 - 659,086)
Upper respiratory infections	1,769 (1,403 - 2,247)	396 (228 - 671)	54 (28 - 104)	364 (262 - 531)	396 (250 - 680)	558 (376 - 860)
Otitis media	1,202 (1,119 - 1,289)	238 (198 - 285)	97 (85 - 110)	255 (232 - 277)	246 (222 - 272)	366 (331 - 403)
Meningitis	140,907 (118,820 - 160,652)	66,751 (52,474 - 82,590)	10,924 (8,461 - 13,408)	30,307 (24,449 - 35,382)	18,312 (13,678 - 22,284)	14,613 (11,601 - 17,352)
Pneumococcal meningitis	36,844 (29,976 - 42,619)	14,465 (10,868 - 18,220)	3,472 (2,669 - 4,411)	9,133 (7,135 - 11,209)	5,469 (3,763 - 7,279)	4,305 (3,306 - 5,502)
H influenzae type B meningitis	29,718 (24,783 - 35,381)	20,515 (15,938 - 25,568)	2,422 (1,869 - 2,987)	3,614 (2,869 - 4,477)	1,769 (1,202 - 2,422)	1,398 (1,028 - 1,806)
Meningococcal meningitis	31,104 (25,407 - 35,579)	13,914 (10,816 - 17,537)	2,399 (1,835 - 3,057)	7,322 (5,869 - 8,844)	4,043 (2,769 - 5,255)	3,426 (2,486 - 4,217)
Other meningitis	43,241 (36,861 - 49,741)	17,857 (14,038 - 22,455)	2,631 (1,944 - 3,212)	10,238 (8,100 - 12,324)	7,031 (5,227 - 9,036)	5,484 (4,195 - 7,017)

Exposure to forces of nature	1,575,513 (1,210,823 - 2,582,602)	549,281 (509,318 - 676,967)	175,299 (132,291 - 299,213)	650,883 (407,254 - 1,318,485)	176,405 (110,339 - 344,299)	23,645 (14,859 - 44,346)
Collective violence and legal intervention						

Web Table 30: Global YLLs by age, sex, and cause in 2013

Web Table 30 - Global YLLs with 95% UI by age, sex, and cause in 2013

Cause	Both Sexes, All Ages	Both Sexes, 0-4 Years	Both Sexes, 5-14 Years	Both Sexes, 15-49 Years	Both Sexes, 50-69 Years	Both Sexes, 70-80 Years
All causes	1,685,005,594 (1,636,381,437 - 1,737,847,726)	538,771,985 (513,425,470 - 566,832,283)	64,948,281 (62,203,900 - 67,995,572)	442,740,824 (425,536,590 - 463,049,682)	381,567,907 (366,357,414 - 398,987,461)	256,976,598 (251,258,687 - 262,739,437)
Communicable, maternal, neonatal, and nutritional diseases	667,793,665 (638,039,231 - 699,967,822)	432,802,113 (405,925,663 - 460,482,136)	32,910,598 (30,528,901 - 35,474,677)	135,195,172 (129,031,274 - 142,384,398)	44,131,341 (41,593,477 - 46,952,917)	22,754,441 (21,040,435 - 23,962,815)
HIV/AIDS and tuberculosis	111,446,283 (105,826,637 - 119,816,904)	9,097,629 (8,137,186 - 10,045,835)	6,370,832 (6,015,281 - 6,755,599)	71,605,278 (67,339,930 - 77,802,942)	20,139,273 (18,519,651 - 22,295,039)	4,233,272 (3,836,142 - 4,662,108)
Tuberculosis	46,146,524 (41,289,222 - 50,544,052)	3,652,623 (2,663,816 - 4,402,321)	1,302,896 (1,012,193 - 1,507,399)	24,962,884 (21,959,290 - 27,815,408)	12,398,011 (11,050,851 - 13,843,095)	3,830,109 (3,439,509 - 4,263,895)
HIV/AIDS	65,299,760 (61,047,474 - 71,976,827)	5,445,005 (4,989,170 - 6,110,871)	5,067,936 (4,752,476 - 5,438,709)	46,642,394 (42,837,029 - 52,000,492)	7,741,261 (7,081,411 - 8,924,134)	403,163 (359,963 - 477,203)
HIV/AIDS resulting in mycobacterial infection	4,034,825 (3,242,344 - 5,051,358)	321,810 (259,378 - 399,871)	278,425 (226,129 - 341,616)	2,898,570 (2,323,852 - 3,649,710)	508,408 (403,791 - 643,618)	27,613 (21,731 - 35,266)
HIV/AIDS resulting in other diseases	61,264,934 (57,248,101 - 67,830,975)	5,123,196 (4,669,002 - 5,742,453)	4,789,512 (4,478,808 - 5,151,325)	43,743,824 (40,075,946 - 48,791,045)	7,232,853 (6,618,195 - 8,284,899)	375,550 (335,114 - 443,719)
Diarrhea, lower respiratory, and other common infectious diseases	235,515,311 (216,891,495 - 254,982,041)	156,655,598 (141,872,850 - 172,772,916)	17,198,921 (15,102,307 - 19,622,272)	29,765,380 (26,761,479 - 33,649,938)	17,125,643 (15,068,753 - 18,795,352)	14,769,769 (13,055,056 - 15,895,289)
Diarrheal diseases	65,942,419 (58,710,200 - 72,995,427)	44,439,990 (37,524,855 - 50,788,387)	4,316,442 (3,596,579 - 5,180,750)	8,049,212 (7,273,101 - 8,928,408)	5,395,277 (4,611,993 - 6,364,493)	3,741,498 (3,203,229 - 4,365,694)
Intestinal infectious diseases	15,172,745 (8,406,717 - 24,780,391)	5,296,073 (2,798,584 - 8,791,725)	4,646,252 (2,673,023 - 7,260,376)	4,803,027 (2,518,185 - 8,188,168)	368,270 (188,926 - 653,719)	59,122 (34,078 - 96,507)
Typhoid fever	10,969,124 (5,846,450 - 18,164,797)	3,652,109 (1,838,026 - 6,214,989)	3,432,884 (1,943,823 - 5,439,985)	3,565,577 (1,846,200 - 6,155,554)	274,844 (132,509 - 490,256)	43,710 (23,726 - 73,358)
Paratyphoid fever	3,782,171 (2,035,140 - 6,462,793)	1,375,435 (700,130 - 2,368,769)	1,168,219 (642,021 - 1,926,687)	1,149,534 (577,632 - 2,061,725)	77,828 (35,890 - 149,972)	11,155 (5,748 - 19,979)
Other intestinal infectious diseases	421,450 (368,804 - 478,774)	268,529 (226,279 - 315,602)	45,149 (36,740 - 55,555)	87,916 (77,048 - 99,815)	15,598 (13,459 - 17,958)	4,258 (3,635 - 4,985)
Lower respiratory infections	112,902,240 (102,623,087 - 121,688,299)	77,637,425 (69,508,018 - 85,655,764)	4,345,732 (3,701,636 - 5,061,922)	11,026,710 (9,505,612 - 12,088,162)	9,468,818 (7,687,663 - 10,332,310)	10,423,555 (8,925,322 - 11,189,560)
Upper respiratory infections	167,969 (137,801 - 205,311)	70,723 (48,393 - 105,159)	8,966 (5,368 - 14,701)	49,320 (38,554 - 64,251)	27,431 (19,426 - 39,692)	11,529 (8,423 - 16,510)
Otitis media	110,169 (101,332 - 118,666)	40,010 (34,254 - 46,376)	15,584 (13,733 - 17,741)	33,815 (31,140 - 36,547)	13,926 (12,836 - 15,052)	6,834 (6,374 - 7,319)
Meningitis	19,335,797 (16,000,508 - 22,743,935)	12,144,460 (8,986,506 - 15,598,356)	1,786,305 (1,459,549 - 2,113,423)	3,891,561 (3,266,130 - 4,344,594)	1,181,437 (938,369 - 1,369,250)	332,034 (269,971 - 381,648)
Pneumococcal meningitis	4,811,095 (3,993,993 - 5,639,841)	2,605,988 (1,870,767 - 3,367,439)	569,517 (458,368 - 689,349)	1,192,804 (991,649 - 1,384,288)	346,221 (265,145 - 425,728)	96,564 (76,841 - 118,501)
H influenzae type B meningitis	4,801,619 (3,833,340 - 5,863,360)	3,775,844 (2,815,583 - 4,799,281)	397,304 (323,106 - 473,234)	478,387 (392,939 - 555,032)	118,147 (88,014 - 150,808)	31,937 (24,532 - 38,906)
Meningococcal meningitis	4,147,395 (3,431,968 - 4,956,845)	2,526,662 (1,860,360 - 3,297,404)	404,300 (325,747 - 496,684)	892,551 (750,489 - 1,007,223)	249,442 (187,299 - 296,018)	74,440 (58,245 - 87,463)
Other meningitis	5,575,688 (4,666,630 - 6,470,440)	3,235,966 (2,382,537 - 4,111,243)	415,183 (331,401 - 490,233)	1,327,819 (1,122,475 - 1,522,031)	467,627 (382,340 - 563,926)	129,093 (103,674 - 158,387)
Encephalitis	4,575,116 (3,797,366 - 5,687,401)	2,199,018 (1,622,464 - 3,027,517)	709,406 (537,425 - 950,970)	1,214,589 (973,746 - 1,587,752)	366,262 (297,123 - 490,377)	85,840 (66,422 - 108,736)
Diphtheria	253,523 (126,465 - 535,988)	180,320 (70,490 - 449,595)	45,718 (14,067 - 135,810)	22,890 (10,900 - 49,329)	4,595 (1,459 - 14,964)	--
Whooping cough	5,125,388 (1,883,530 - 11,538,953)	4,816,086 (1,771,178 - 10,841,084)	256,347 (87,079 - 649,408)	49,047 (19,997 - 117,729)	3,909 (1,842 - 8,974)	--
Tetanus	3,641,498 (2,300,278 - 4,899,905)	2,717,992 (1,443,536 - 3,884,952)	150,634 (116,376 - 209,889)	415,608 (323,685 - 564,501)	273,125 (177,640 - 421,100)	84,139 (55,173 - 132,301)
