

Table S3 Statistical comparison of the miR-125b expression levels in the HR+ breast cancer patients treated with endocrine therapy alone or combined to chemotherapy who relapsed or not at 7 years ($n = 11$).

	Number of patients (%)		P^a
	Patients who did not relapse ($n = 7$)	Patients who relapsed ($n = 4$)	
miR-125b-5p expression levels			
Low ^b	7 (100%)	1 (25%)	0.02
High	0 (0%)	3 (75%)	

^a P (Fisher exact test) was considered significant when $P < 0.05$.

^b the median value was used to dichotomise the cohort into two groups with either low or high miR-125b-5p expression levels.
