Supplementary Figures

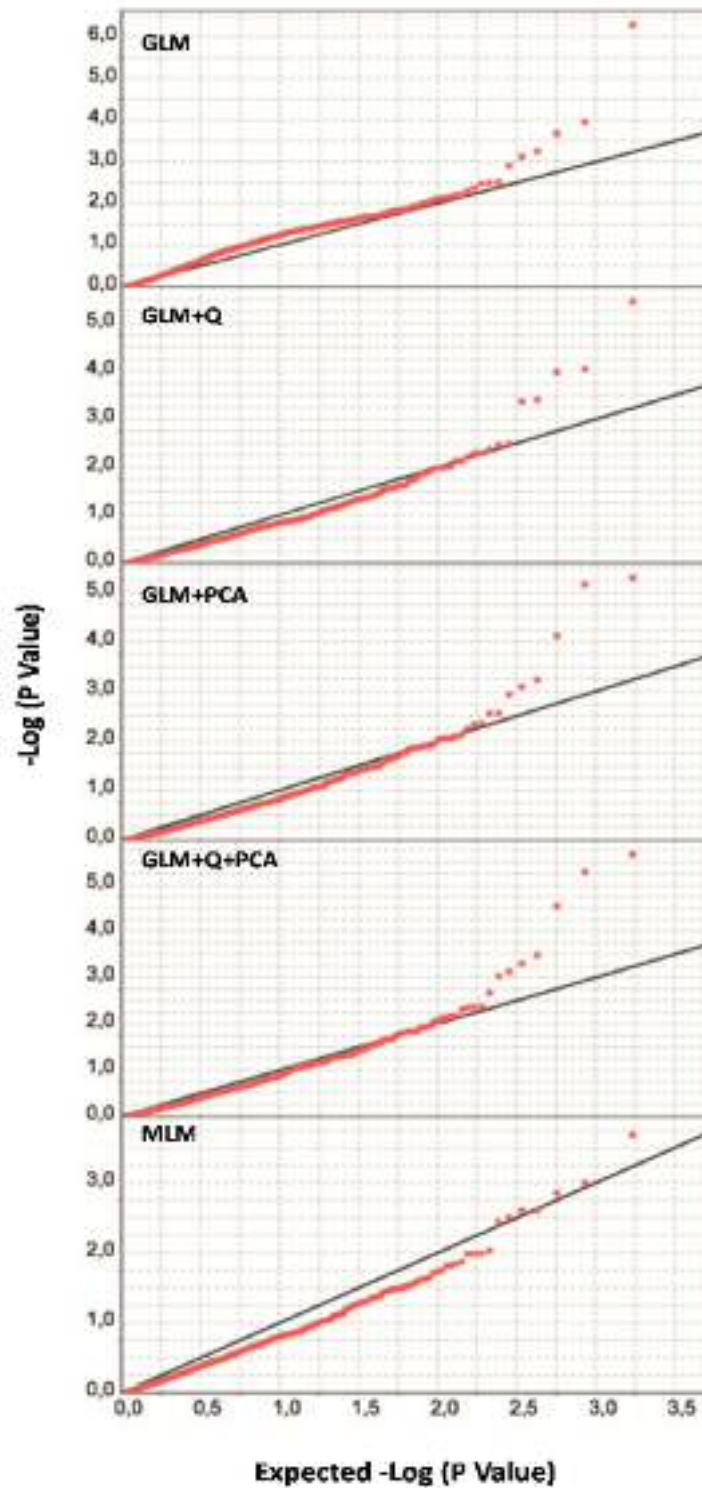

Supplementary Figure 1. **A.** Adult Plant resistance, measured as percentage of the seedling resistance in a subset of 54 oat accessions. **B.** Scatterplot of Principal Component Analysis scores of components 1 and 2 based on 1587 DArT and SSR markers used in this study in the oat subset. Represented are the genotypes belonging to cluster 1 (red), cluster 2 (green), cluster 3 (violet) and cluster 4 (blue). **C.** Linkage disequilibrium matrix in the oat subset. Pair-wise LD values of polymorphic sites displaying r^2 above the diagonal and the corresponding p -values from rapid 1000 shuffle permutation test below the diagonal. Each cell represent the comparison of two pairs of marker sites with the color codes for the presence of significant LD. Colored bar code for the significance threshold levels in both diagonals is shown.

Supplementary Figure 2. Distribution of p values for the different models used in this study for the association between markers and rust resistance. Axes represented the expected p values versus the observed p values in the negative log10 scale where the solid line represent the null expectation (absence of type I error).

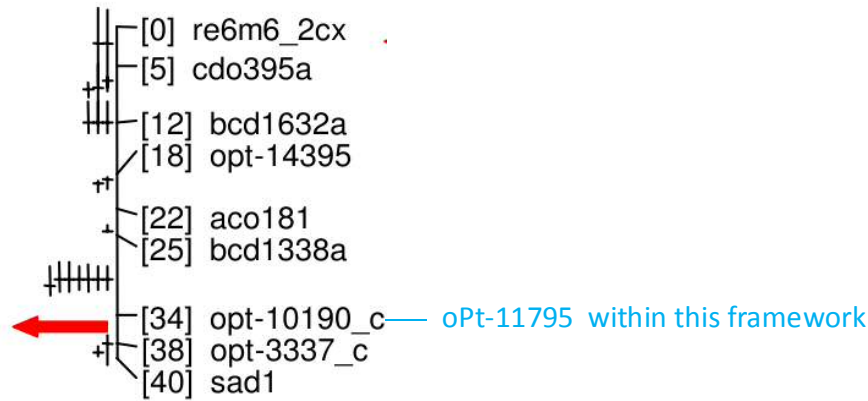

Supplementary Figure 3. Distribution of p values for the different models used in this study for the association between markers and powdery mildew resistance at seedling stage. Axes represented the expected p values versus the observed p values in the negative \log_{10} scale where the solid line represent the null expectation (absence of type I error).

Supplementary Figure 4. Distribution of p values for the different models used in this study for the association between markers and powdery mildew resistance at adult plant stage. Axes represented the expected p values versus the observed p values in the negative \log_{10} scale where the solid line represent the null expectation (absence of type I error).
