

A**B**

FIG. S1. Isolation and genotyping of *ilvC* disruptant. (A) Schematic diagram for the isolation of the *ilvC* disruptant. Black and gray arrowheads indicate primers used for the construction of the *ilvC* disruption vector and genotyping by PCR (see Fig. S1B), respectively. *ilvI*, acetohydroxyacid synthase large subunit; *ilvH*, acetohydroxyacid synthase small regulatory subunit; *ilvC*, acetohydroxyacid isomeroreductase; *fah*, fumarylacetoacetate hydroxylase. (B) Genotyping of the *ilvC* loci of KGMA0119 (wild-type) and its derivatives by PCR. The *ilvC* loci of KGMA0119, KGMA0704 (ΔpyrE), and KGMA5511 ($\Delta\text{pyrE} \Delta\text{ilvC::pyrE}$) strains were amplified from total DNA using primers *ilvC-F2* and *ilvC-R2*. See Figure S1A for the annealing position of each primer.
