The top 25 *P. gingivalis* gene sets whose member genes are predominantly upregulated with respect to the chronic control group. Column 1 includes the gene set name (bold) as provided by MSigDB and the rank of the gene set based on Normalized Enrichment Score (NES). Gene set names that are not in bold are gene sets that are redundant or partially redundant and included within larger bolded gene sets. The NES ranged from 2.32 (for Basal Cell Carcinoma, the top ranked gene set) to 1.66 (REACTOME Class B2 Secretin Family Receptors, the 25th-ranked gene set). FDR *q* range: 0.001-0.186. Column 2 lists those genes within the gene set that significantly contributed to the enrichment of the gene set. Genes within redundant gene sets are preceded by corresponding superscripts for the gene set to which they belong.

The top 25 *P. gingivalis* gene sets whose member genes are predominantly downregulated with respect to the chronic control group. Column 1 includes the gene set name (bold) as provided by MSigDB and the rank of the gene set based on Normalized Enrichment Score (NES). Gene set names that are not in bold are gene sets that are redundant or partially redundant and included within larger bolded gene sets. The NES ranged from -3.24 (for REACTOME Integration of Energy Metabolism, the top ranked gene set) to -2.33 (KEGG PPAR Signaling Pathway, the 25th-ranked gene set). FDR $q < 1 \times 10^{-30}$. Column 2 includes those genes within the gene set that significantly contributed to the enrichment of the gene set. Genes within redundant gene sets are preceded by corresponding superscripts for the gene set to which they belong.

The top 25 *C. pneumoniae* gene sets whose member genes are predominantly upregulated with respect to the chronic control group. Column 1 includes the gene set name (bold) as provided by MSigDB and the rank of the gene set based on Normalized Enrichment Score (NES). Gene set names that are not in bold are gene sets that are redundant or partially redundant and included within larger bolded gene sets. The NES ranged from 2.64 (for Microbody Peroxisome, the top ranked gene set) to 2.03 (Vitamin Metabolic Process, the 25th-ranked gene set). FDR *q* range: 0-0.001. Column 2 includes those genes within the gene set that significantly contributed to the enrichment of the gene set. Genes within redundant gene sets are preceded by corresponding superscripts for the gene set to which they belong.

The top 25 Western diet gene sets whose member genes are predominantly upregulated with respect to the chronic control group. Column 1 includes the gene set name (**bold**) as provided by MSigDB and the rank of the gene set based on Normalized Enrichment Score (NES). Gene set names that are not in bold are gene sets that are redundant or partially redundant and included within larger bolded gene sets. The NES ranged from 2.97 (for KEGG Lysosome, the top ranked gene set) to 2.42 (REACTOME Cell Cycle Checkpoints, the 25th-ranked gene set). FDR $q < 1 \times 10^{-30}$. Column 2 includes those genes within the gene set that significantly contributed to the enrichment of the gene set. Genes within redundant gene sets are preceded by corresponding superscripts for the gene set to which they belong.

Supplemental Table 7 - Gene Set Enrichment Analysis. Negative enrichment: Western diet group vs. chronic control group

The top 25 Western diet gene sets whose member genes are predominantly downregulated with respect to the chronic control group. Column 1 includes the gene set name (bold) as provided by MSigDB and the rank of the gene set based on Normalized Enrichment Score (NES). Gene set names that are not in bold are gene sets that are redundant or partially redundant and included within larger bolded gene sets. The NES ranged from -3.43 (for G Protein Coupled Receptor Activity, the top ranked gene set) to -1.92 (Digestion, the 25th-ranked gene set). FDR q range: 0 – 0.015. Column 2 includes those genes within the gene set that significantly contributed to the enrichment of the gene set. Genes within redundant gene sets are preceded by corresponding superscripts for the gene set to which they belong.
