## Supplemental figures

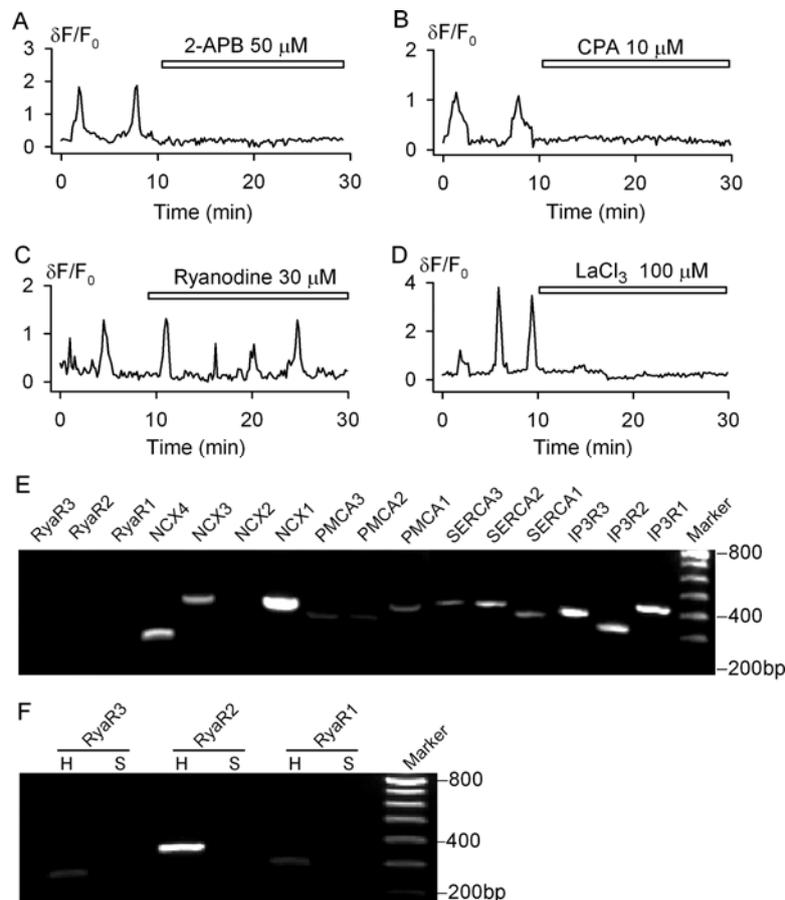

Figure S1.  $\text{Ca}^{2+}$  signaling pathways in human MSCs.

**A.** The IP3Rs blocker 2-APB suppressed spontaneous  $\text{Ca}^{2+}_i$  oscillations (n=27). **B.** SERCAs inhibitor CPA abolished  $\text{Ca}^{2+}_i$  oscillations (n=27). **C.** RyRs blocker showed no significant effect on  $\text{Ca}^{2+}_i$  oscillations (n=24). **D.**  $\text{LaCl}_3$ , a SOC entry blocker blocked  $\text{Ca}^{2+}_i$  oscillations (n=25). **E.** RT-PCR results show significant mRNAs for IP3R1-3, SERCA1-3, PMCA1-3, NCX1, NCX3 and NCX4, but not for RyRs. **F.** Messenger RNAs for RyR1-3 were detectible human SH-SY5Y neuroblastoma cells (H), but not in stem cells (S) using three primers of RyRs in E.

**Abbreviations:** IP3R: IP3 receptor; SERCA: sarco/endoplasmic reticulum  $\text{Ca}^{2+}$ -ATPase; PMCA: plasma membrane  $\text{Ca}^{2+}$ -ATPase. NCX:  $\text{Na}^+$ - $\text{Ca}^{2+}$  exchanger; RyR: ryanodine receptor; H: total RNA extracted from human SH-SY5Y neuroblastoma cells; S: human mesenchymal stem cells.

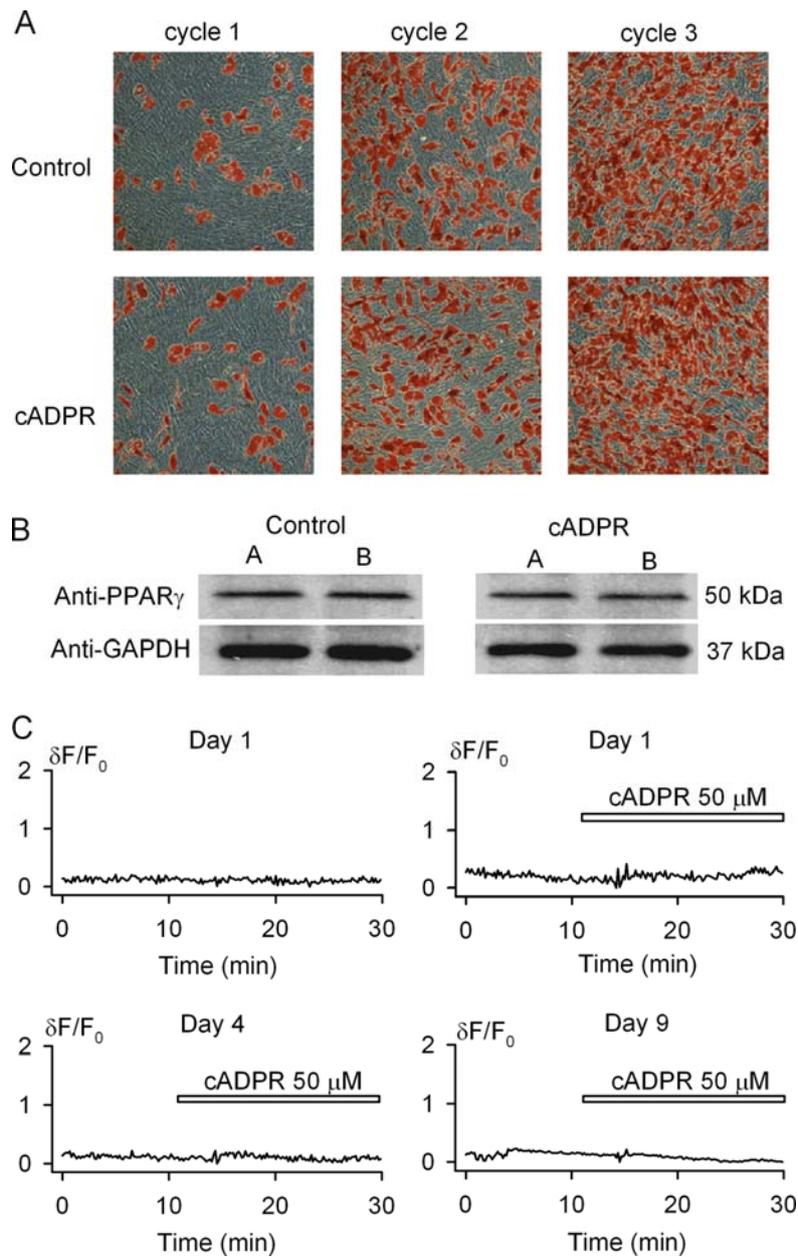

Figure S2. **Effects of cADP ribose on adipogenesis in human MSCs.**

**A.** Images showing adipogenic differentiation of human MSCs at induction cycle 1, 2 and 3. cADP-ribose showed no significant effect on adipogenesis in human MSCs. Similar results were obtained in a total of 3 experiments. **B.** No difference was found in PPAR $\gamma$  protein expression in the differentiated adipocytes (day 9) with and without the treatment of 50  $\mu$ M cADPR. **C.** No spontaneous Ca $^{2+}_i$  oscillations were observed during adipogenesis on day 1, day 4 and day 9. cADP-ribose did not initiate Ca $^{2+}_i$  transient or Ca $^{2+}_i$  oscillations in these cells (n=32 for each).

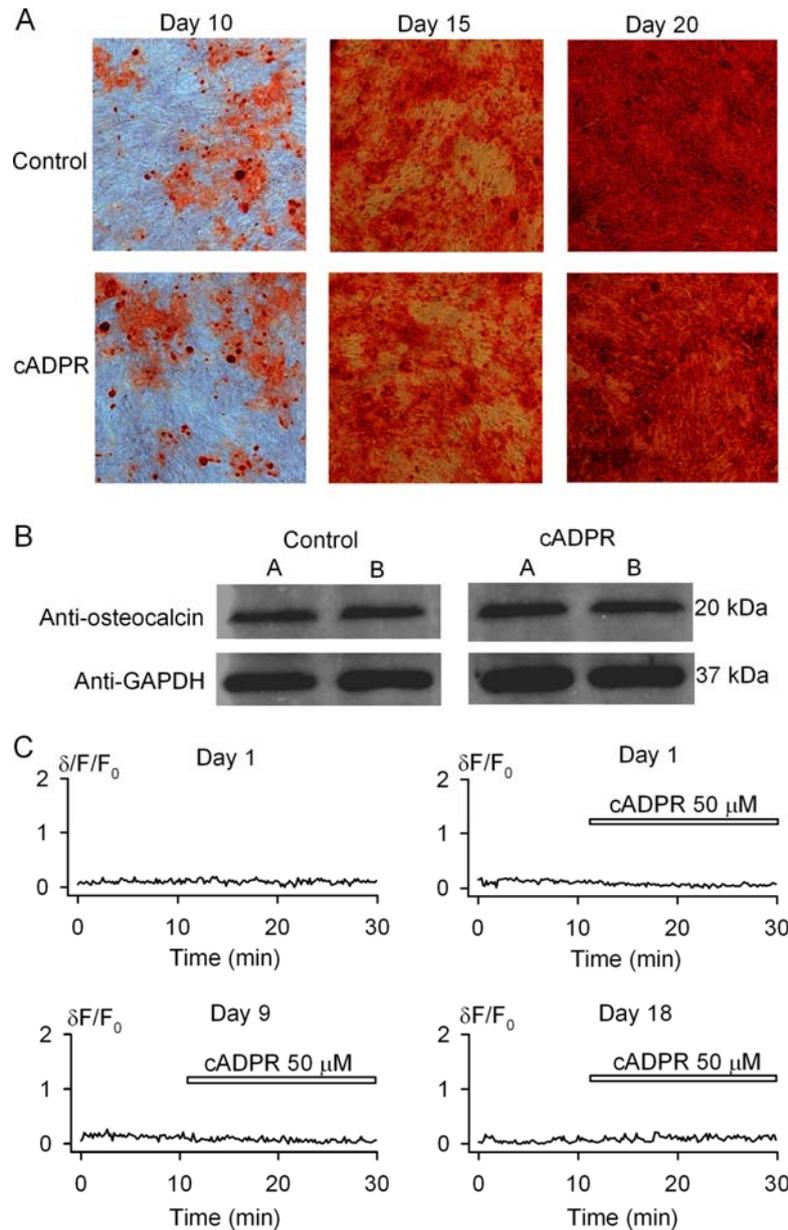

Figure S3. **Effects of cADP ribose on osteogenesis in human MSCs.**

**A.** Images showing the osteogenesis on day 10, day 15 and day 20 by Alizarin red S staining. cADP ribose had no significant effect on osteogenesis in human MSCs. Similar results were obtained in a total of 3 experiments. **B.** No difference was found in osteocalcin protein expression in the differentiated osteocytes (day 18) with and without the treatment of 50 μM cADPR. **C.** No spontaneous  $Ca^{2+}_i$  oscillations were observed during osteogenesis on day 1, day 9 and day 18. Cyclic ADP ribose did not initiate  $Ca^{2+}_i$  transient or  $Ca^{2+}_i$  oscillations in these cells (n=32 for each).
