

Supporting Information Fig. 1.

Supporting information Fig. 1. To investigate whether GSI blocks the appearance of early activation markers in CD8⁺ T cells, splenocytes were activated for 2 days with anti-CD3_ε and anti-CD28 in the presence of GSI or DMSO control. Following activation, purified CD8⁺ T cells were assayed for CD25, CD44 and CD69 expression. As shown above, treatment with GSI has no discernable effect on early markers of T cell activation in CD8⁺ T cells.
