

Supplemental Figure 1. Relative amount of XyG *O*-acetylation. Quantification is based on the relative abundance of XyG oligosaccharides detected by MALDI-TOF MS after digestion of wall material with a XyG-specific endoglucanase. The percent acetylation is the total relative quantity of the acetylated oligosaccharides (XXLG-Ac, XXFG-Ac, and XLFG-Ac) divided by the sum of oligosaccharides that can be *O*-acetylated (XXLG, XXLG-Ac, XXFG, XXFG-Ac, XLFG, XLFG-Ac). Error bars indicate standard deviation ( $n \geq 6$ ); \* indicates statistically significant difference from Col-0 (Student's T-Test,  $p < 0.01$ ).

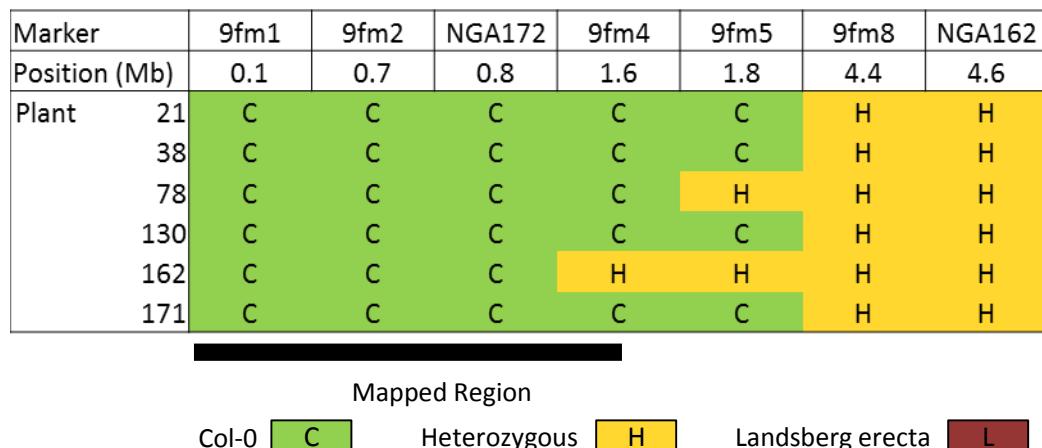

Supplemental Figure 2. XyG oligosaccharide profiling of F2 plants from a cross between *axy9.1* and *Arabidopsis* ecotype Landsberg erecta (Ler). (A) Relative abundance of non-acetylated XLFG based on MALDI-TOF MS. Dashed lines indicate cutoff values used for calling the phenotype as mutant (*axy9.1*-like) or wild type (Col-0-like). (B) Histogram of the relative abundance of non-acetylated XLFG in the F2 population. (C) Segregation analysis of the F2 population.

A

B

Supplemental Figure 3. Mapping of *oxy9.1*. (A) Col-0 allele frequency based on SSLP marker analysis (Supplemental Table 1). (B) Fine mapping of the region of Col-0-enriched region on chromosome 3 using six mutant plants with recombination events within the region of interest.

Supplemental Table 1. Markers used for genetic linkage analysis of *axy9.1*. Simple sequence length polymorphism (SSLP) markers were obtained from [www.arabidopsis.org](http://www.arabidopsis.org). Cleaved amplified polymorphic sequence (CAPS) markers (**bold**) were based on the Col-0 reference genome and a list of SNPs present in the Landsberg erecta ecotype ([www.arabidopsis.org](http://www.arabidopsis.org)). CAPS markers require digestion with EcoRI following the PCR reaction.

Criteria (additive)	# Candidate SNPs
Total SNPs	8827
Unique to <i>axy9.1</i>	1987
Homozygous	652
Causing AA change	148
Mapped region (Chr3, 0-1.6 Mb)	2

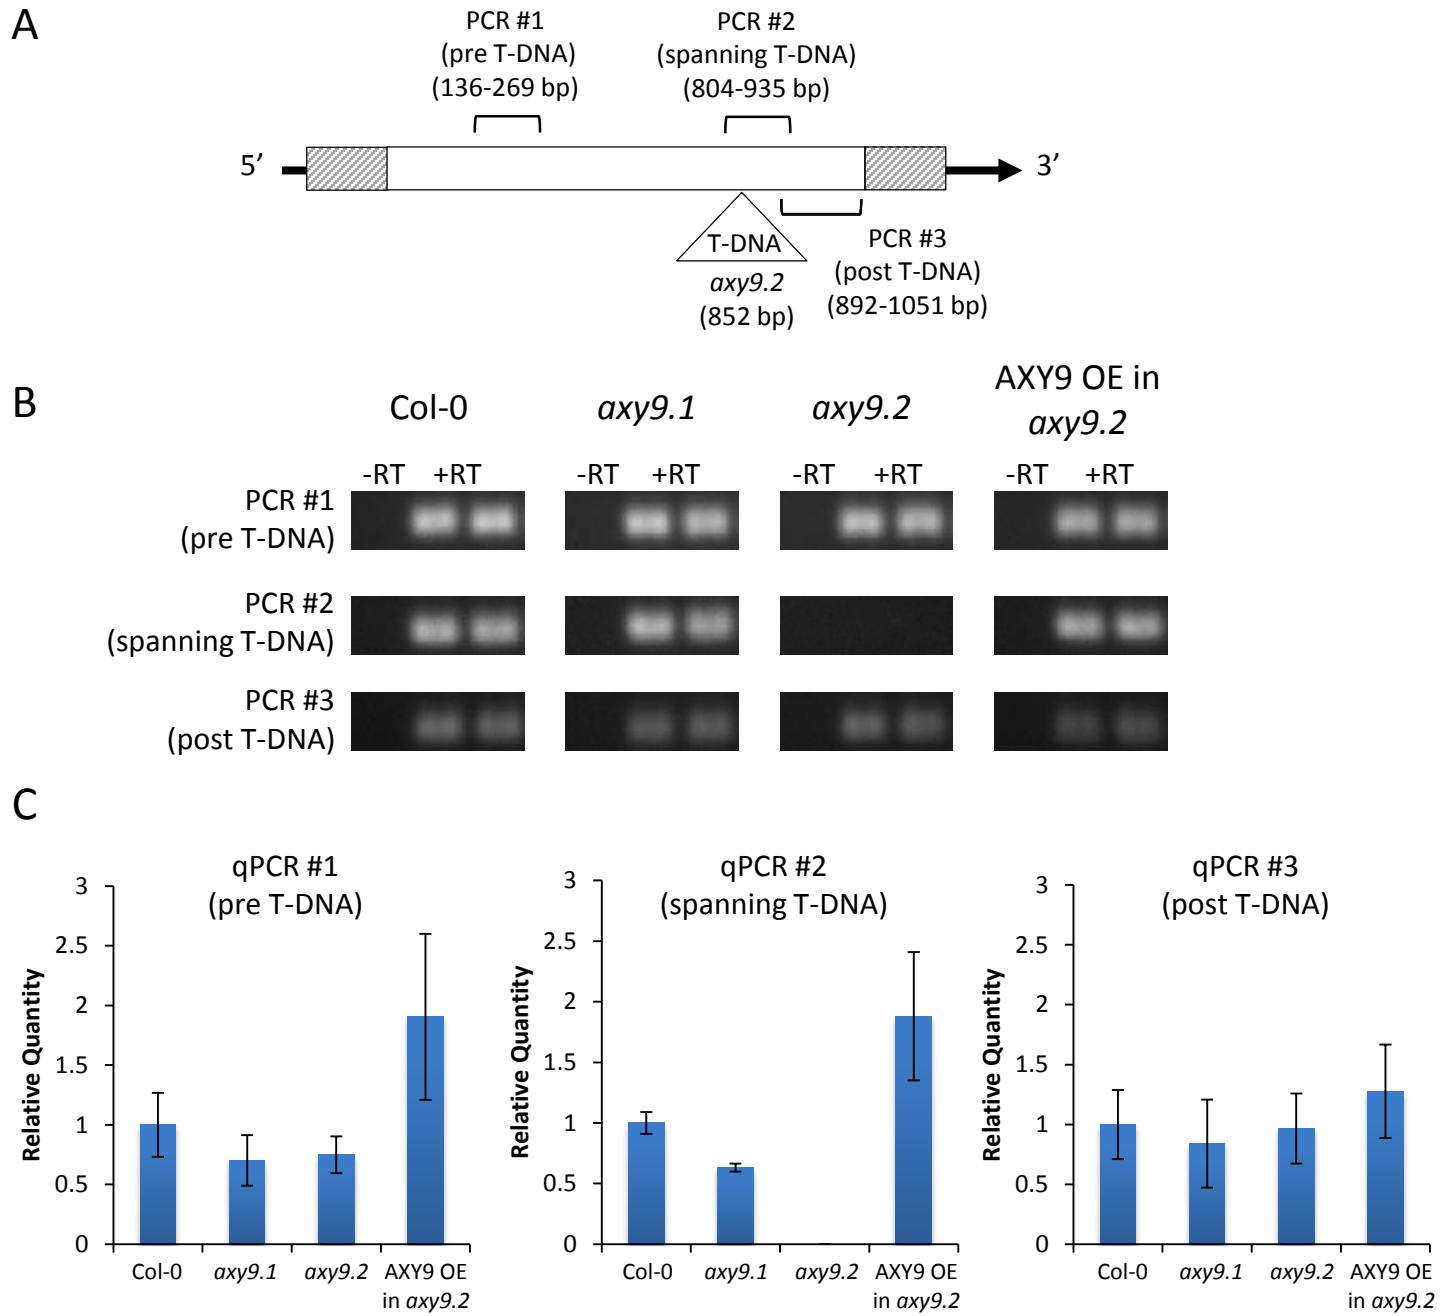

Supplemental Table 2. Genomic sequencing of *axy9.1*. Detected SNPs, relative to the Col-0 reference genome, were filtered against sequencing data from other *axy* mutants (Günl et al., 2011, Gille et al., 2011) to obtain a specific *axy9.1* SNP set. 652 of these SNPs were found to be homozygous based on detection frequency and 148 of the homozygous SNPs were predicted to result in amino acids changes. Of these 148 SNPs, two were located within the mapped region on chromosome 3.

Position (bp)	Gene	AA change	Gene Annotation	XyG Acetylation <sup>1</sup> (relative to wild type)
121,177	At3g01323		ECA1-like gametogenesis related family protein	
210,881	At3g01530	Thr62Ile	Member of the R2R3 factor gene family	98 ± 8
364,726	At3g02080		Ribosomal protein S19e family protein	
494,882	At3g02410		Isoprenylcysteine methylesterase-like 2 (ICME-LIKE2)	104 ± 7
603,885	At3g02780		Isopentenyl diphosphate:dimethylallyl diphosphate isomerase	
741,814	At3g03210	Trp276Stop	unknown protein	69 ± 2
1,401,626	At3g05040		Member of importin/exportin family. Involved in shoot maturation.	
1,506,767	At3g05290		Peroxisomal adenine nucleotide transporter, involved in fatty acid beta-oxidation	

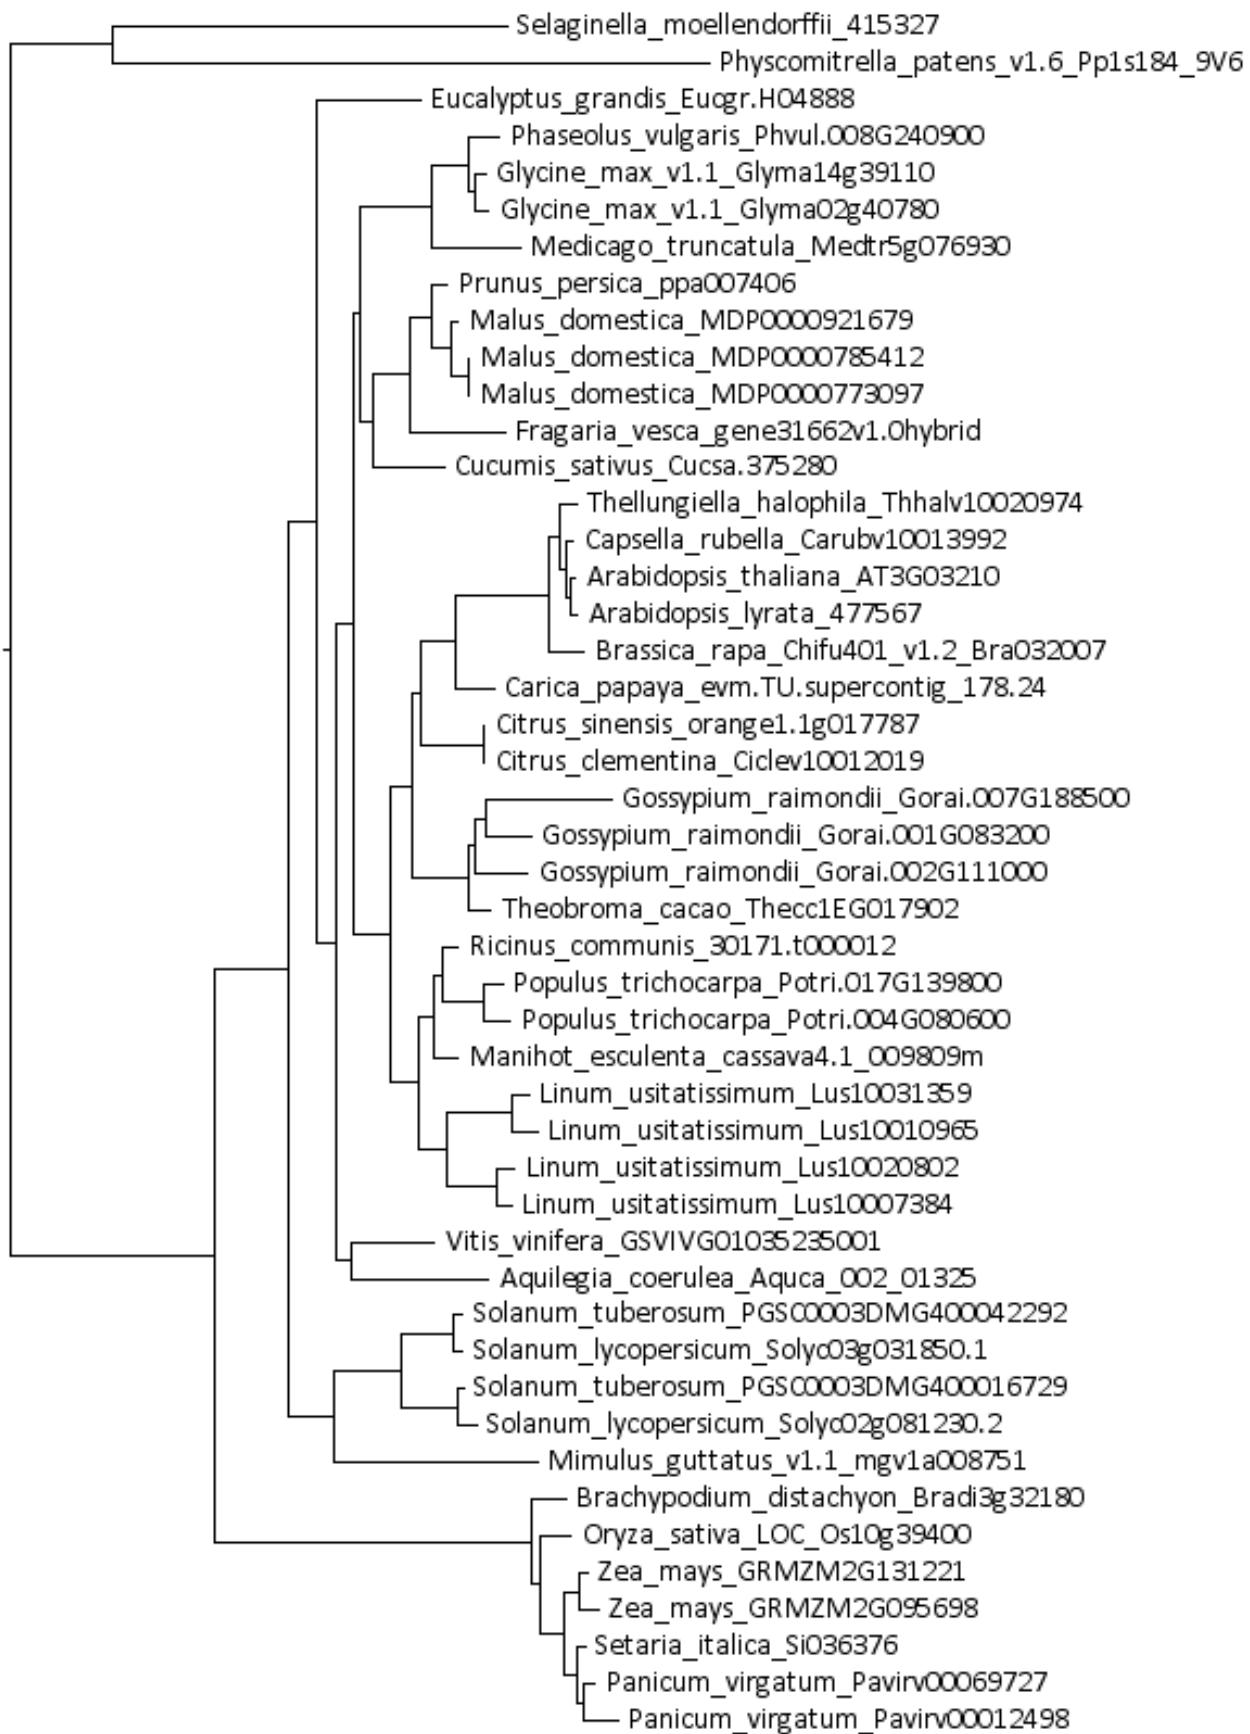

Supplemental Table 3. Candidate SNPs for the basis of the *axy9.1* phenotype in the mapped region. Two out of the eight SNPs detected in genes within the mapped region result in predicted amino acid changes. T-DNA lines with insertions in these candidate genes were obtained and XyG acetylation was measured of leaf tissue relative to wild type. <sup>1</sup>Percent XyG acetylation of possible as a percentage relative to wild type, n = 4.

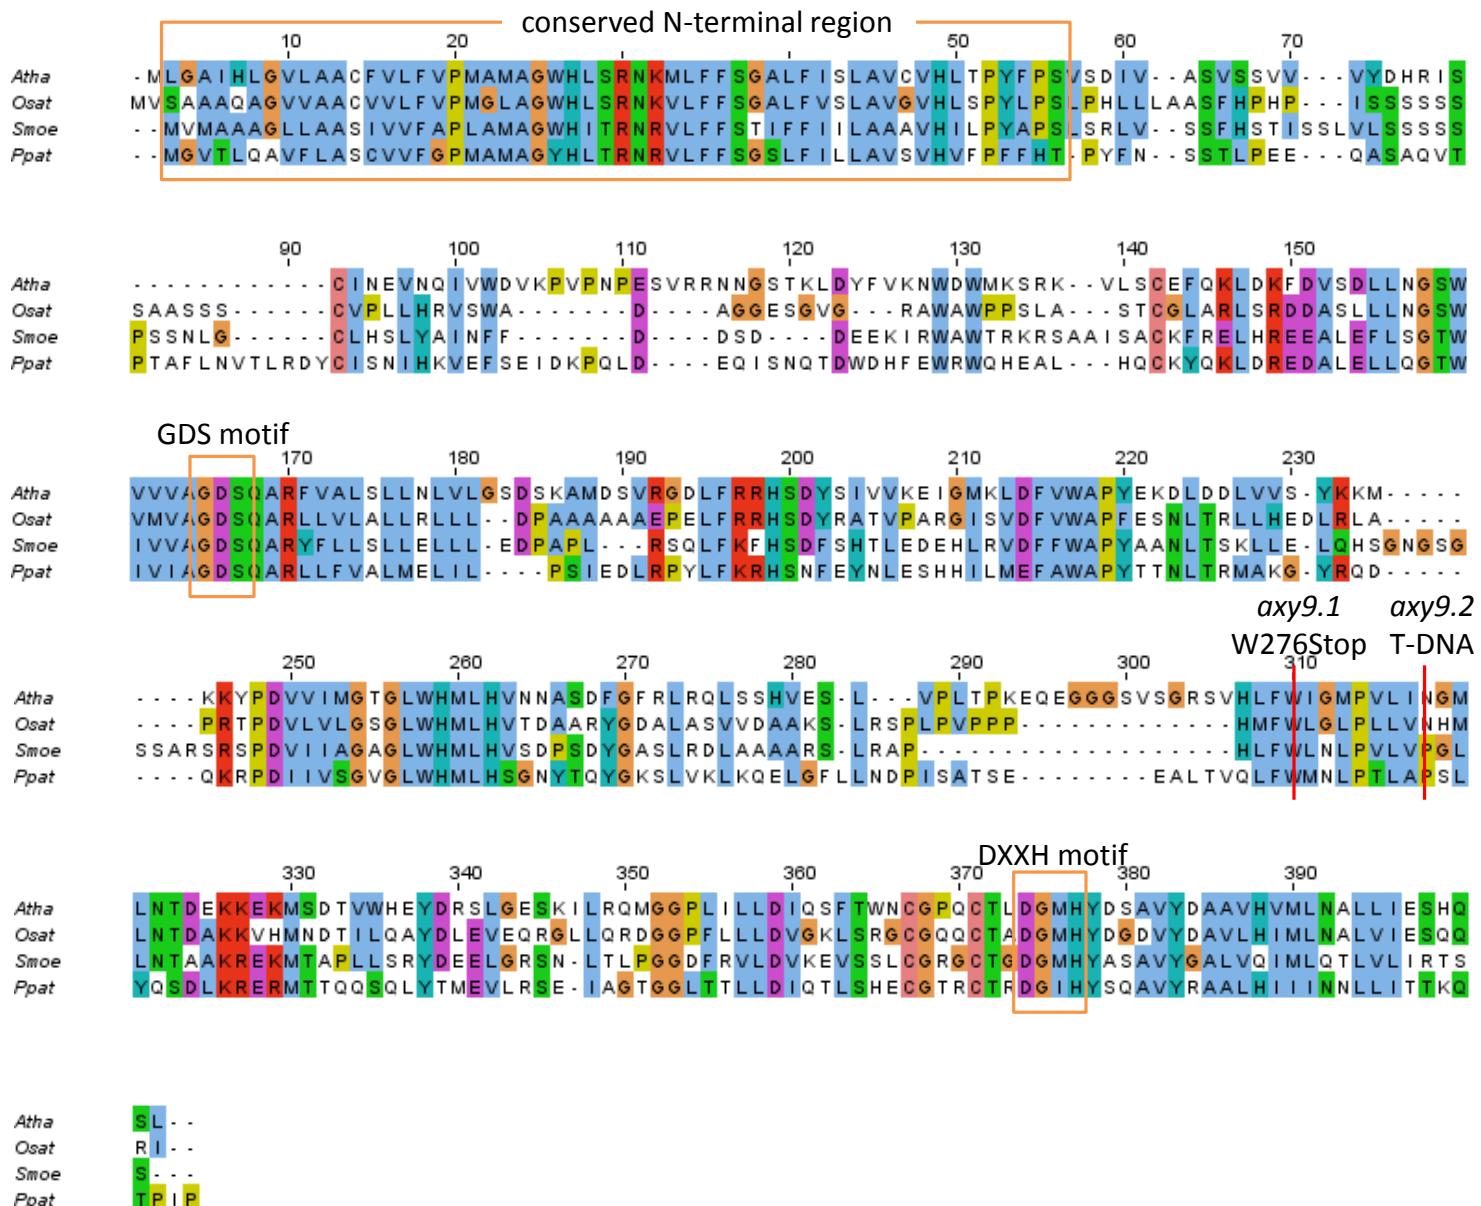

Supplemental Figure 4. Gene and protein model of AXY9. (A) Gene model of AXY9 (*At3g03210*) including the introduced point mutation in *axy9.1* and T-DNA insertion location in *axy9.2*. Striped boxes – untranslated regions; white box – coding sequence. (B) Protein model of AXY9 including the stop codon in *axy9.1* and the insertion in *axy9.2*. Shaded grey box – protein regions of interest. Striped box – aberrant amino acids for the predicted protein in *axy9.2*.

Supplemental Figure 5. Expression profiling of *AXY9* in the *AXY9* mutants in leaves. (A) Gene model of *AXY9* showing the location of the T-DNA insertion in the *axy9.2* allele and the positions of three PCR primer pairs before, spanning, and after the T-DNA insertion (PCR #1, #2, and #3 respectively) relative to the direction of transcription. (B) Qualitative RT-PCR using the three primer pairs for the indicated genotypes. Reverse transcriptase enzyme was included (+RT) or excluded (-RT) from cDNA preparations to check for the presence of genomic DNA contamination. Two independent replicates are shown for the cDNA samples prepared with reverse transcriptase. (C) Quantitative RT-PCR using the three primer pairs with SYBR green for quantification during amplification. The results were normalized to an internal control (*ACTIN 2*, *At3g18780*) and to Col-0. Error bars indicate standard error (n = 3).

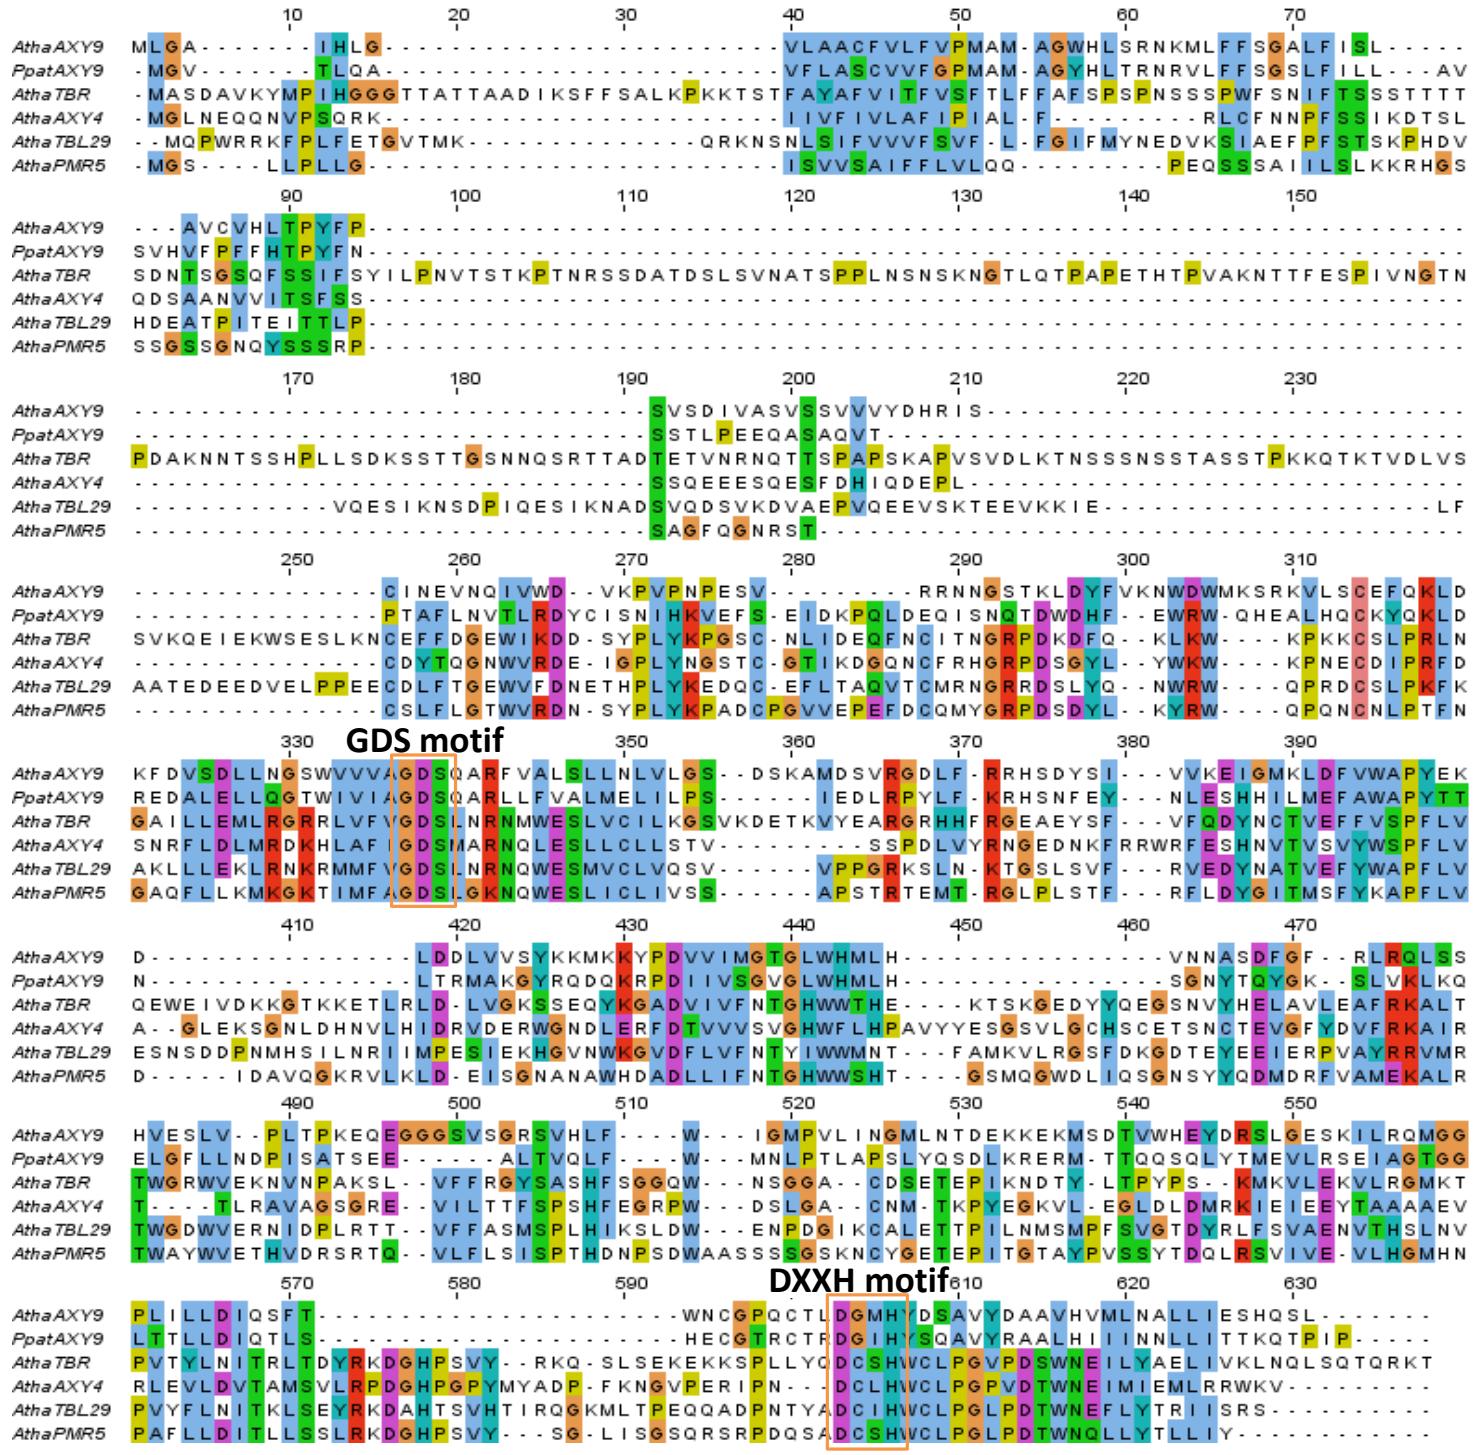

Supplemental Figure 6. AXY9 maximum-likelihood phylogenetic tree. Between one and four putative AXY9 orthologs were identified in each land plant species from the Phytozome database.

Supplemental Figure 7. Alignment of AXY9 protein sequences. Protein sequences were obtained from Phytozome ([www.phytozome.net](http://www.phytozome.net)) and aligned using MUSCLE (Edgar, 2004). Regions of note include the highly conserved N-terminus, the putative catalytic GDS motif (position 157), and the conserved DXXH motif at the C-terminus. The highly conserved N-terminus contains two hydrophobic stretches separated by four hydrophilic residues (SRNK in *Arabidopsis*). The mutation present in *axy9.1*, W276Stop, is marked with a red line. *Atha* – *Arabidopsis thaliana*, *Osat* – *Oryza sativa*, *Ppat* – *Physcomitrella patens*, *Smoe* – *Selaginella moellendorffii*.

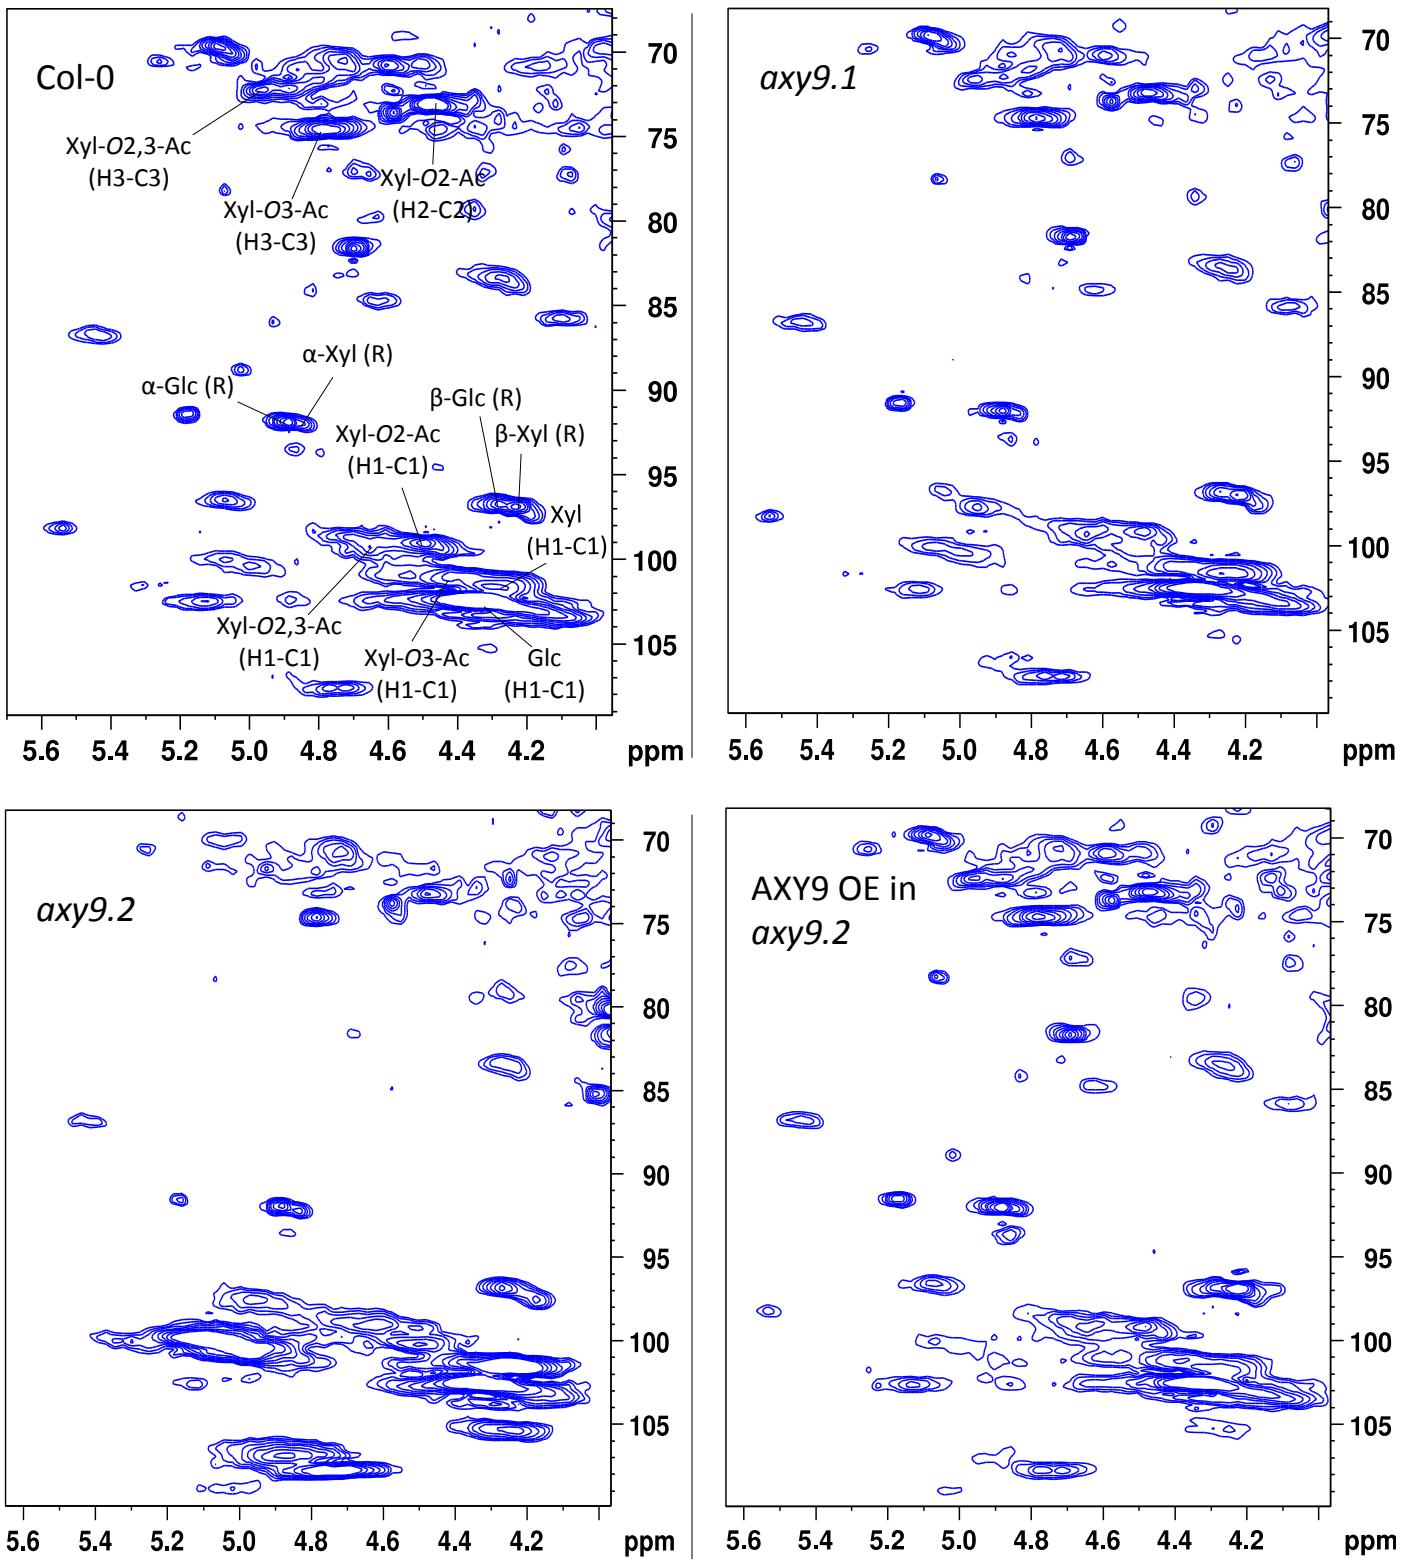

Edgar, Robert C. "MUSCLE: multiple sequence alignment with high accuracy and high throughput." *Nucleic acids research* 32.5 (2004): 1792-1797.

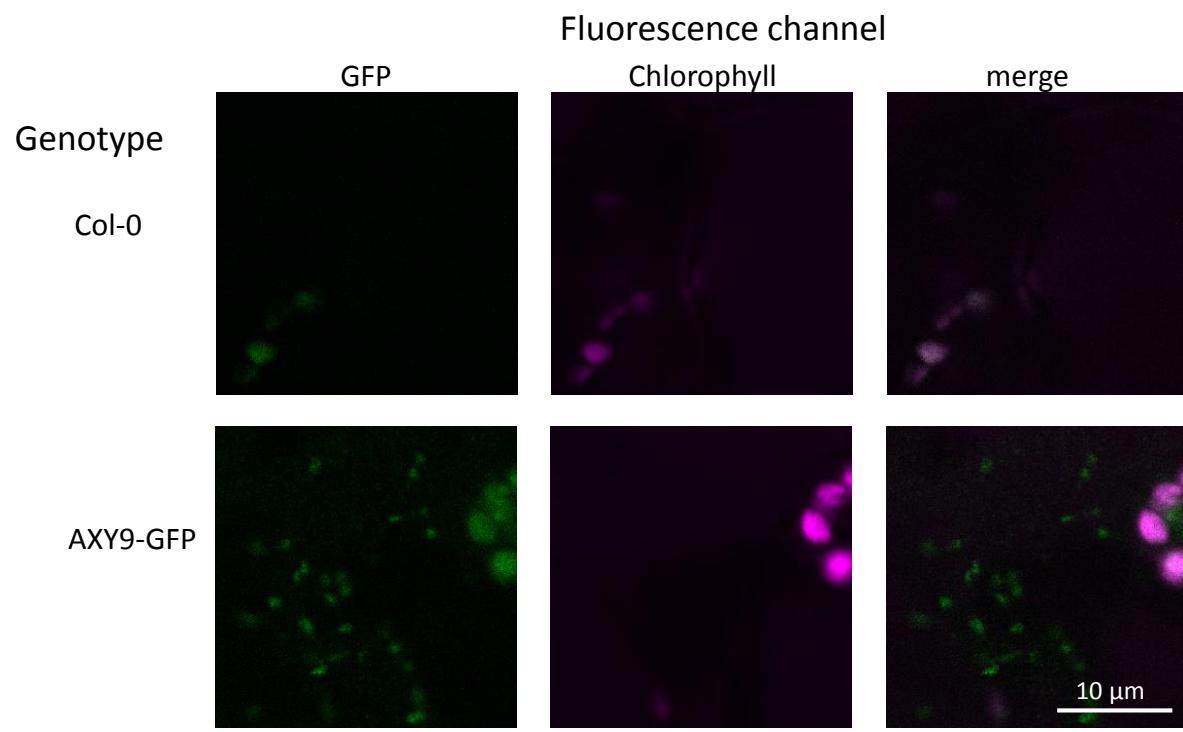

Pairwise Sequence Identity					Pairwise Sequence Similarity						
PpatAXY9	AthaTBR	AthaAXY4	AthaTBL29	AthaPMR5	PpatAXY9	AthaTBR	AthaAXY4	AthaTBL29	AthaPMR5

PpatAXY9		14	17	15	18	PpatAXY9		26	31	29	32
AthaTBR			21	26	26	AthaTBR			34	40	37
AthaAXY4				24	27	AthaAXY4				39	41
AthaTBL29					31	AthaTBL29					43

Supplemental Figure 8. Alignment and sequence similarity of AXY9 and TBL protein sequences. Multiple sequence alignment (top) and pairwise percent identity and similarity values (bottom) of protein sequences obtained from Phytozome ([www.phytozome.net](http://www.phytozome.net)). Multiple and pairwise alignments were done using MUSCLE (Edgar, 2004). Conservation is observed in the GDS and to a lesser extent the DXXH motifs. *Atha* – *Arabidopsis thaliana*, *Ppat* – *Physcomitrella patens*.

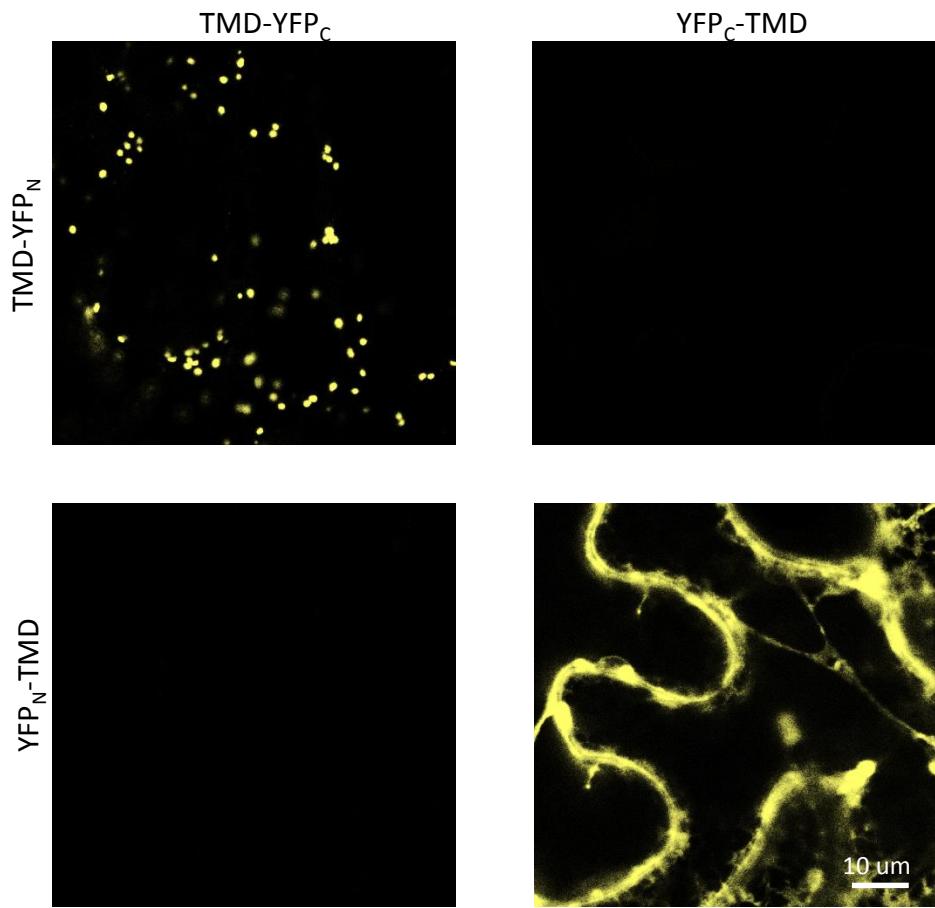

Edgar, Robert C. "MUSCLE: multiple sequence alignment with high accuracy and high throughput." *Nucleic acids research* 32.5 (2004): 1792-1797.

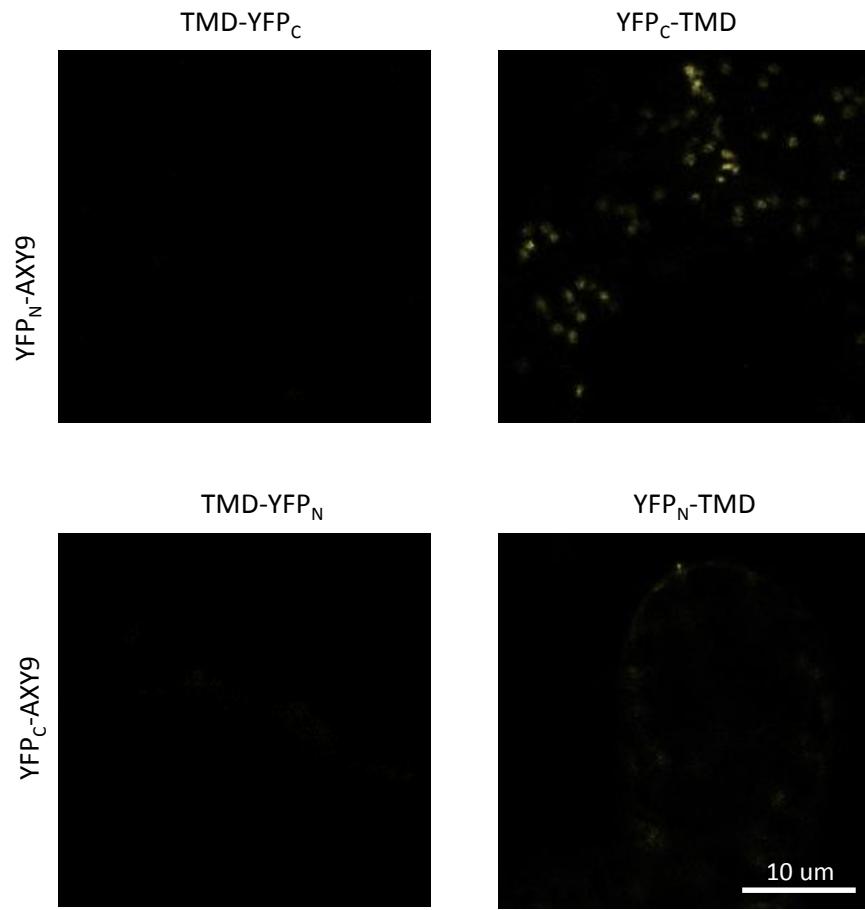

Supplemental Figure 9. 2D HSQC NMR spectrum of dissolved stem tissue. The  $^1\text{H}$  (x-axis) /  $^{13}\text{C}$  (y-axis) NMR spectra for wild type (WT), Per-O-acetylated arabinoxylan from wheat, *axy9.1*, *axy9.2* and AXY9 OE in *axy9.2* mutants. Prominent peaks corresponding to known polysaccharide linkages are labeled (Cheng et al., 2013 & Chong et al., 2014). A quantification of the peaks related to acetylated polysaccharides is shown in Table 1.

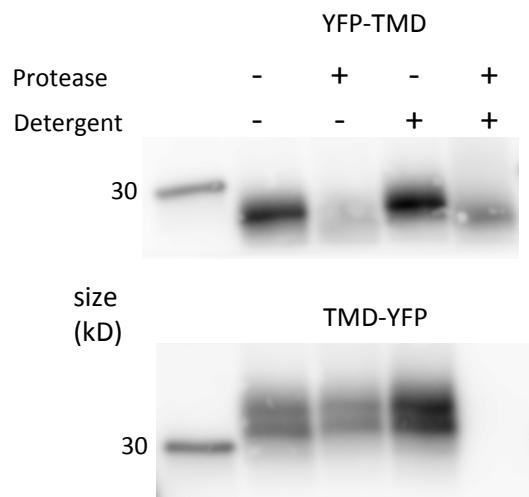

Supplemental Figure 10. Subcellular localization of AXY9-GFP in *Arabidopsis*. Confocal microscopy was used to image leaf tissue of stably transformed *Arabidopsis* plants expressing AXY9-GFP.

Supplemental Figure 11. Split-YFP controls. Confocal microscopy was used to image *N. benthamiana* leaf tissue infiltrated with split-YFP fusion constructs.

Supplemental Figure 12. Split-YFP AXY9 N-terminal fusions. Split-YFP AXY9 protein fusions (YFP<sub>N</sub>-AXY9 and YFP<sub>C</sub>-AXY9) were coexpressed with TMD-YFP<sub>N/C</sub> and YFP<sub>N/C</sub>-TMD in *N. benthamiana*. Leaf tissue was imaged for YFP fluorescence using a confocal microscope.

Supplemental Figure 13. Protease protection assay of internal and external Golgi controls. The YFP-TMD and TMD-YFP peptide fusions have been reported to result in cytosolic and luminal orientations respectively for the YFP domain (Søgaard et al., 2012).
