

Supplemental Figure S4.  $\Delta pplA$  mutant and wild-type *L. monocytogenes* infection of IFN $\gamma$ -treated bone marrow-derived macrophages (BMMØ). Measurement of intracellular growth of wild type and  $\Delta pplA$  in BMMØ using an MOI of 1:1. Macrophages were treated with 1 ng/mL IFN $\gamma$  twenty-four hours prior to bacterial infection. Data shown is representative of three-independent experiments.
