C. elegans RBPs are the best homologs of *Drosophila* RBPs reported by Olesnický *et al.* (2014) by BLASTp search (E values are given). Sources of alleles are indicated above. Abbreviations: (NBRP) the Mitani Lab through the *C. elegans* National Bioresource Project of Japan; (UBC) *C. elegans* Reverse Genetics Core Facility at the University of British Columbia, (OMRF) *C. elegans* Reverse Genetics Core Facility at the Oklahoma Medical Research Foundation. UBC and OMRF are part of the international *C. elegans* Gene Knockout Consortium. RNAi clones (clone location given) are from the Ahringer library (Geneservice LTD; Fraser *et al.* 2000; Kamath *et al.* 2003) or were constructed for this study (plasmid construction described in Table S2).

**gk939577/gk463873* results in a conceptual translation of the first 436 amino acids unchanged followed by 3 missense changes and a stop codon. There are 308 codons after the stop. The LA domain and the LARP4/5-like domain are within the first 436 amino acids.

***gk454899* is a single missense change R251C in a residue conserved in flies, fish, and mammals. The residue does not fall within anRNA recognition motif (RRM) but falls in a region between two RRMs.
