Supplemental Table 1. Litter number and gender of mice used in all behavioral experiments. Male mice are indicated by M and are highlighted in blue, female mice and indicated by an F and are highlighted in red.

Supplemental Figure 1. Frequency of seizures in *Tsc1*^{flox/flox};CaMKIIα-cre mice

Supplemental Figure 1. Mean number of seizure observed by video recording in a 12 hour session over the time course of 3-7 weeks postnatal. Control mice are shown as blue circle, while *Tsc1*^{flox/flox};CaMKIIα-

cre mice are red squares. All $Tsc1^{flox/flox};CaMKII\alpha$ -*cre* mice developed spontaneous seizures by week 5-6.
