

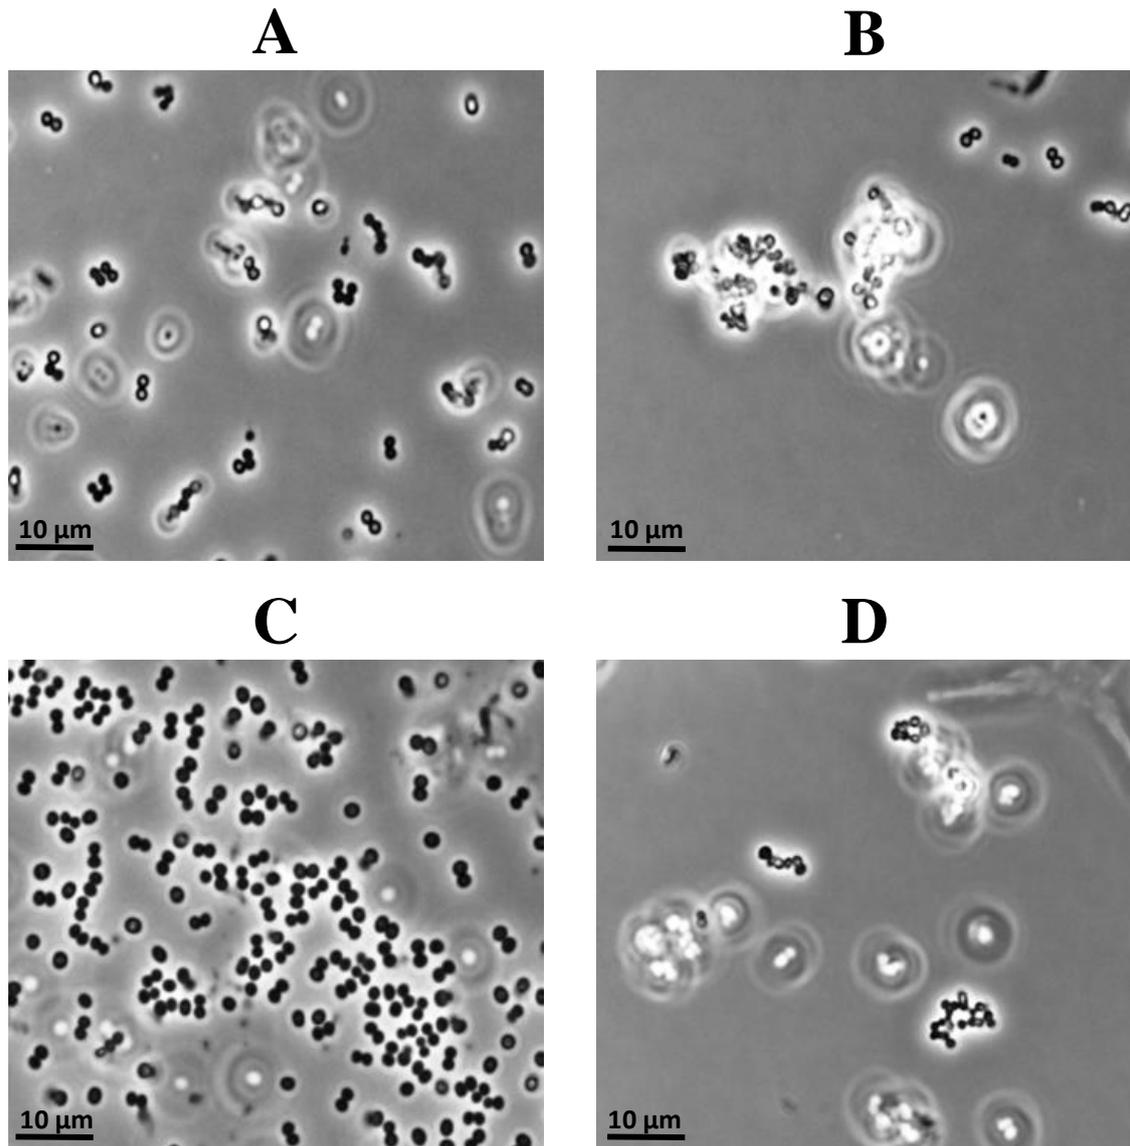

**Figure S1.** Phage sensitivity to environmental conditions. (A) Temperature and (B) pH, of phages phiIPLA-RODI (black) and phiIPLA-C1C (white). Values represent the mean  $\pm$  standard deviation of three independent experiments. Bars having an asterisk are significantly different from the control (ANOVA;  $P < 0.05$ ).

**Figure S2:** Progressive MAUVE comparison at the nucleotide level of phages belonging to the *Myoviridae* family infecting Staphylococcal species. Coloured blocks surround a region of the genome sequence that aligns and is homologous to part of another genome. Regions with lack of homology are outside these blocks or white inside the blocks. The height of the similarity profile corresponds to the average of conservation in that region of the genome sequence.

**Figure S3.** Optical microphotographs of (A) *S. aureus* IPLA16; (B) *S. aureus* IPLA16-R71 resistant to phage phiIPLA-RODI; (C) *S. epidermidis* LO5081 and (D) *S. epidermidis* LO5081-R49 resistant to phage phiIPLA-C1C. Cultures were grown in TSB at 37°C with shaking during 16 h.

**Table S3:** Putative promoters of phages phiIPLA-RODI and phiIPLA-C1C. -10 and -35

boxes are underlined. Nucleotide positions and presence of the TG dinucleotide were

also indicated. \* Promoters without AT-rich upstream sequences.

| Terminator         | Strand | Sequence (5'-3')   | Nt position   | Stem length | ΔG    | After gene |

**Table S4:** Putative terminators of phages phiIPLA-RODI and phiIPLA-C1C. The underline sequence corresponds to the terminator stem.

Lowercase letter in RNA motifs indicates the spacer element between the stem-loop and T-rich region.
