

Supplemental Figure 1

K562, LAMA, BV173/E255K cells were exposed to bosutinib (20-150 nmol/L) and/or PF (0.05-0.3 μ mol/L) for 48-72h, after which the percentage of apoptotic cells was determined by 7-AAD positivity using flow cytometry (*= $p < 0.05$, significantly greater than values obtained for bosutinib or PF treatment alone).
