

S. Figure 7. Analysis of site-specific EHH around a core SNP within *dhfr*. With Malawi as the reference population, *Rsb* metrics indicate no signal for positive selection in *dhfr* but do indicate a signal for positive selection in neighbouring *PF3D7_0417400*. It appears that the beneficial allele is sweeping up in all 4 populations, causing attenuation of inter-population differences at *dhfr*. The longest haplotypes appear to occur in Thailand, producing the strongest signal in *PF3D7_0417400*.
