

Supplementary material to

Akkermansia muciniphila adheres to enterocytes and strengthens the integrity of epithelial cell layer”

by

Justus Reunanen, Veera Kainulainen, Laura Huuskonen, Noora Ottman, Clara Belzer, Heikki Huhtinen, Willem M. de Vos, Reetta Satokari

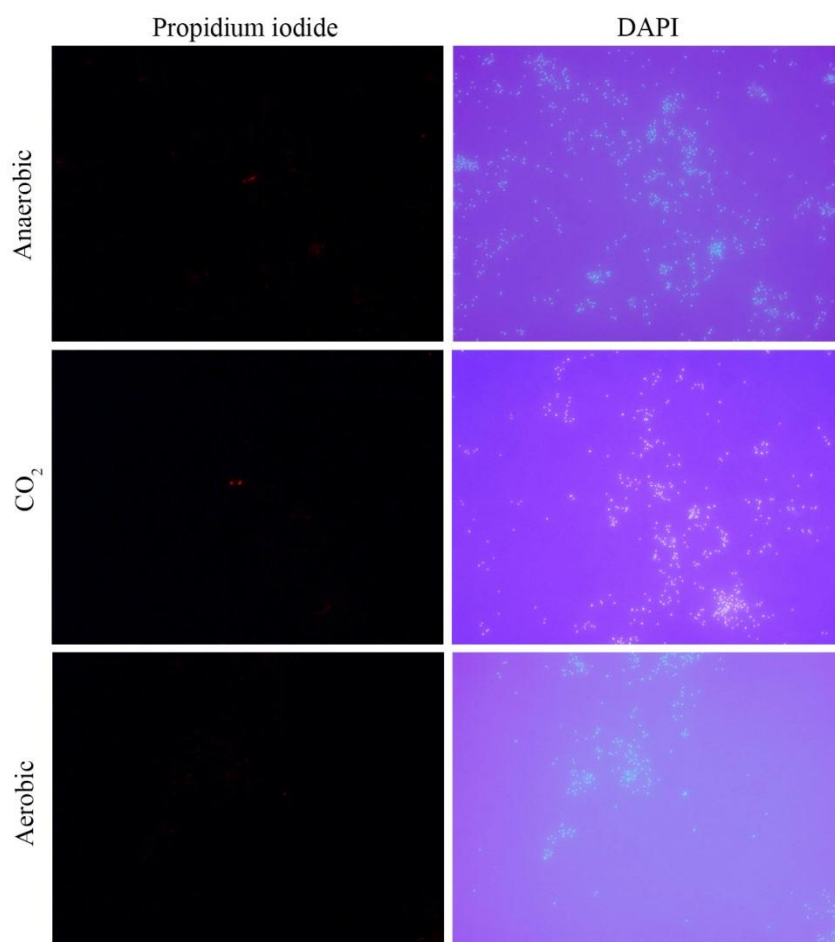

Figure S1. Oxygen tolerance of *A. muciniphila* cells that were kept under different atmospheres and live-dead stained with DAPI (blue) and propidium iodide (PI, red).

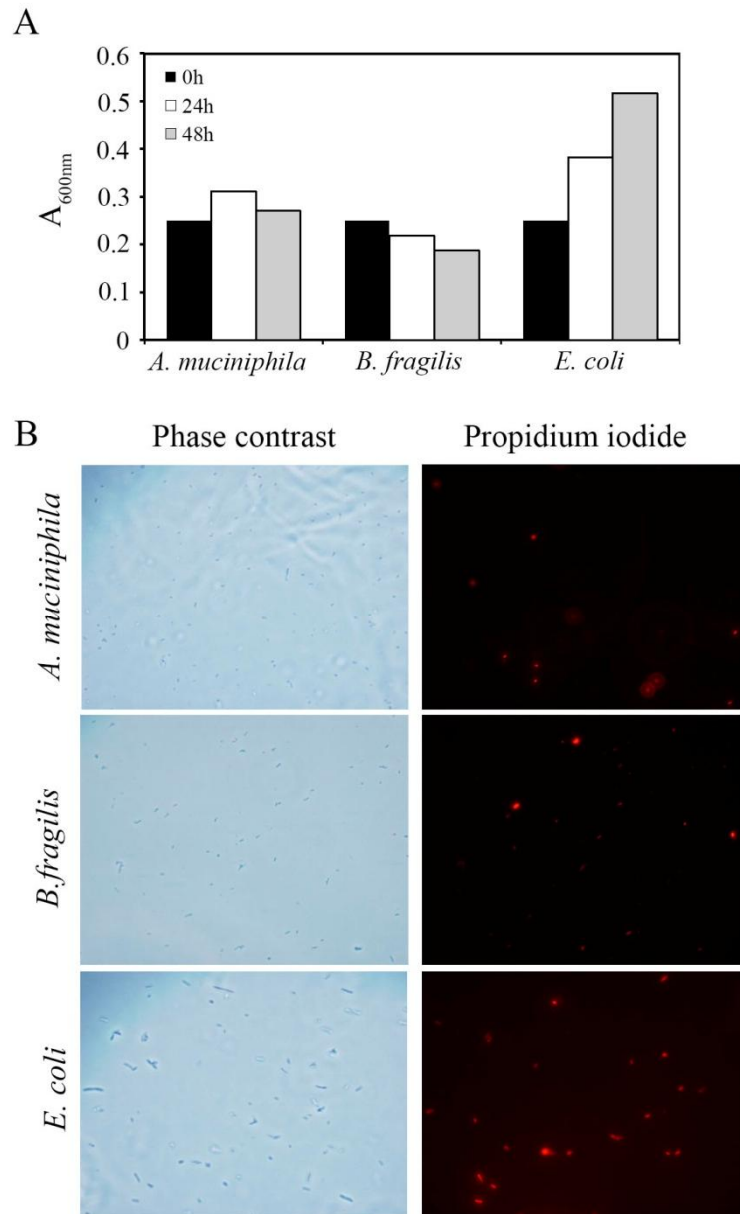

Figure S2. The growth and viability of the bacterial strains in the TER-assay conditions. The amount of bacteria incubated in the TER-assay medium at different time points was determined by OD_{600nm} measurement (A), and the viability of the bacteria after 48 h incubation was determined by propidium iodide (PI) staining (B).
