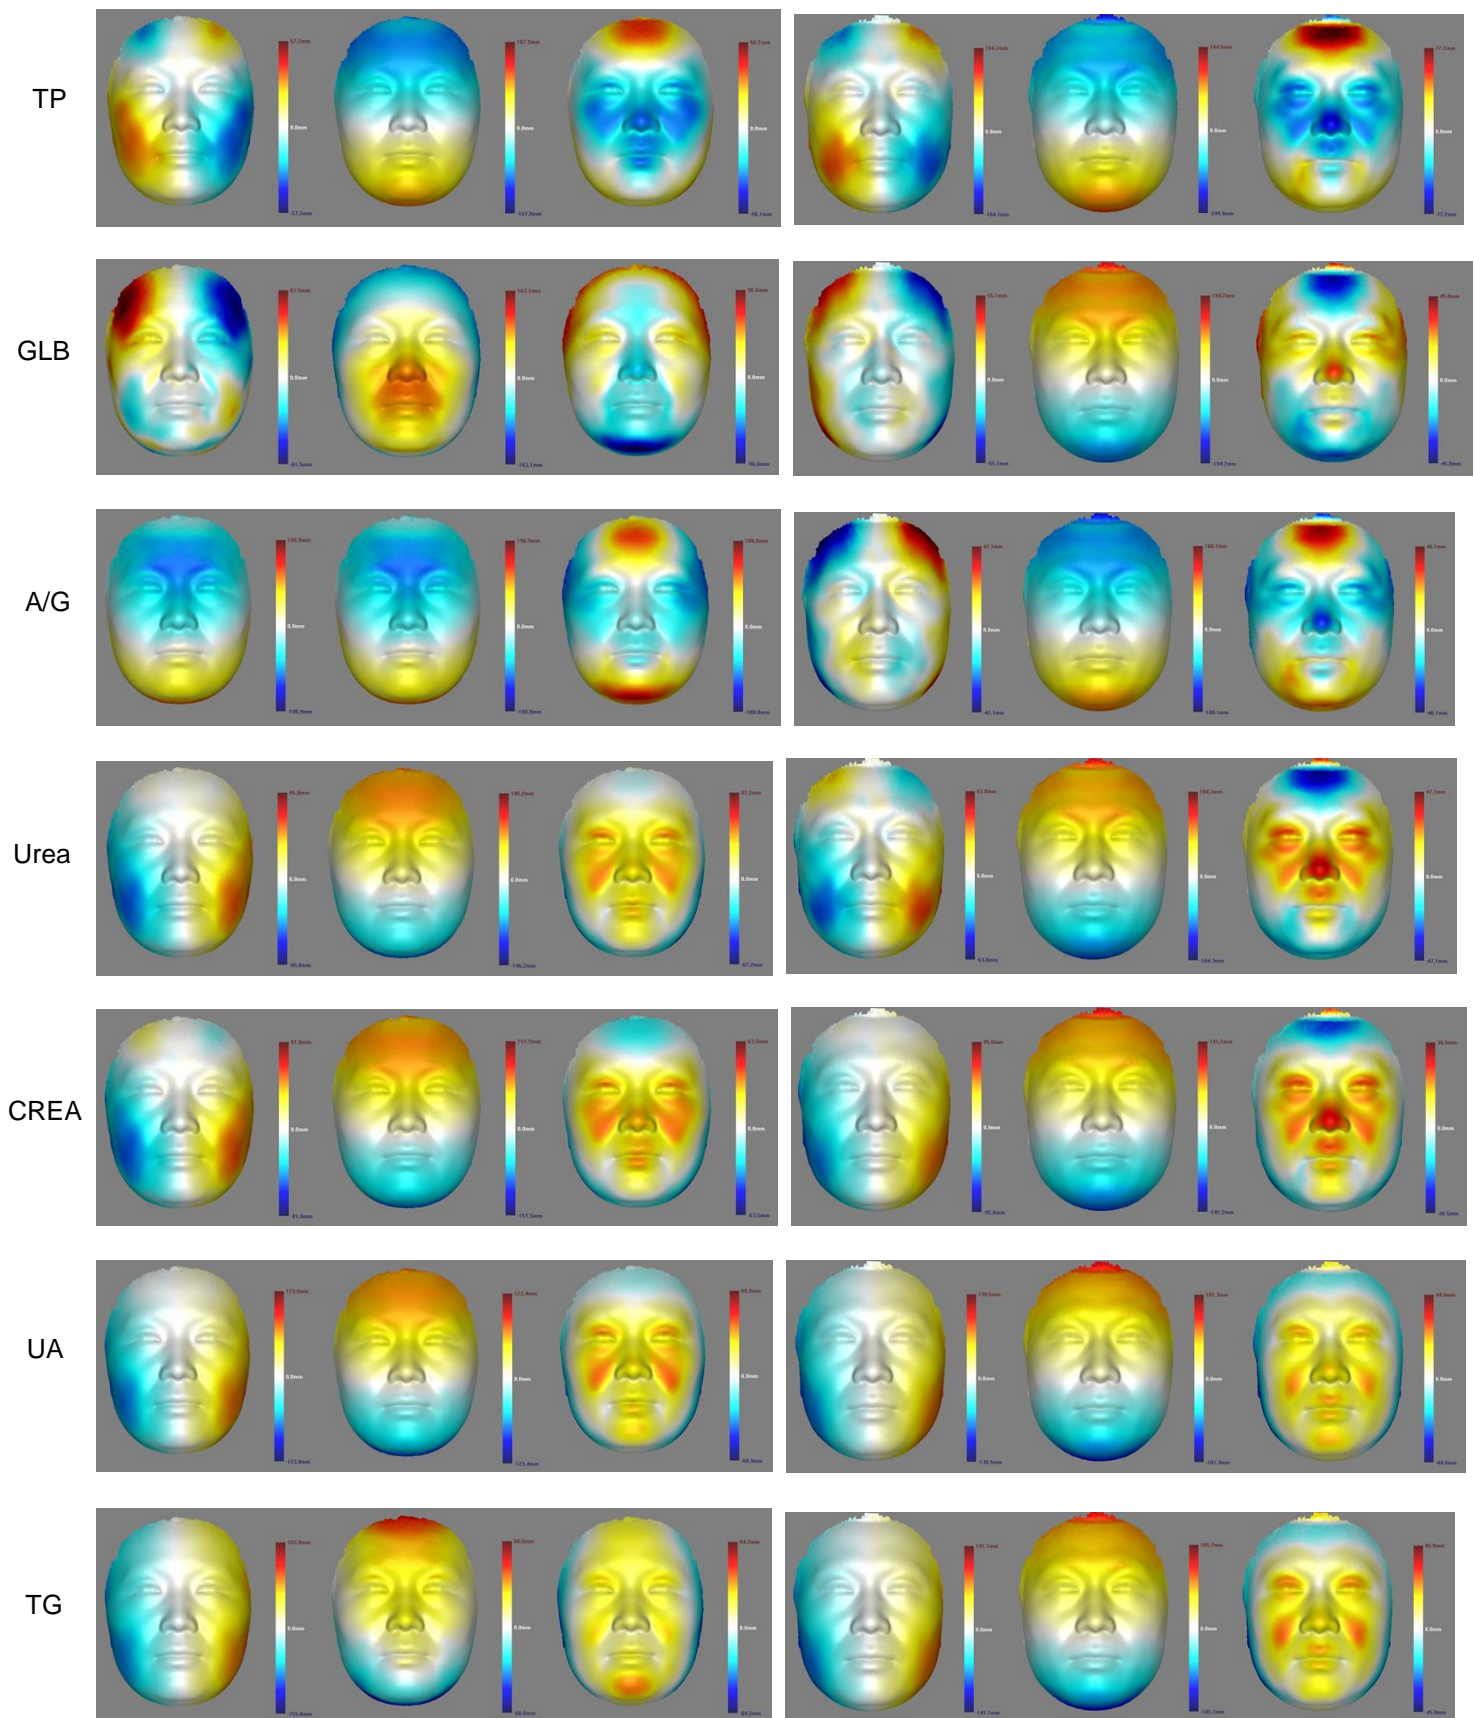

Fig. S9. The heat map of 3D-effects showing loading values of PLS component 1 correlated with other indicators from 18 blood serum indicators and 24 blood-cell related indicators (except CHO, LDL-C, HDL-C and ALB in Fig. 4) on female and male faces. Loading values were multiplied by 10,000. Red and blue denote, respectively, higher and lower values along x-, y- and z-axes.
