

Figure S7. CKD and diabetes do not drive clustering of periodontitis microbial communities. Graphs represent PCoA plots of distances among samples. Graphs A and C are based on the Jaccard index and therefore indicate differences in community composition. Graphs B and D are based on the θ YC index and therefore indicate differences in community structure. Amova comparisons were not statistically significant (A, Jaccard CKD vs No CKD: $P=0.89$; B, θ YC CKD vs No CKD: $P=0.436$; C, Jaccard Diabetes vs No Diabetes: $P=0.463$; D, θ YC Diabetes vs No Diabetes: $P=0.334$).
