

## Web Material

### Cardiometabolic Risk Factors in Young Adults Born Preterm

Web Table 1. Confirmation of Lengths of Gestation of the Subjects, Northern Finland, 2009-2011.

Web Table 2. Characteristics of the participants and nonparticipants according to Northern Finland Birth Cohort (NFBC) 1986 and Finnish Medical Birth Register data, Northern Finland 1985-1986 and 2001-2002.

Web Appendix: Laboratory Analyses

Web Table 3. Measured and Calculated Cardiometabolic Markers Grouped According to Pathophysiological Pathways, Northern Finland, 2009-2011.

Web Table 4. Geometric means (SD) for controls and mean differences (95% CIs) in plasma lipids in young women and men born preterm compared with their controls.

Web Table 1. Confirmation of Lengths of Gestation of the Subjects, Northern Finland, 2009-2011.

Gestational age according to NFBC/FMBR data	Gestational age according to medical records		
	Early preterm	Late preterm	Controls
<34 wk.	145	3	4
34-36 wk	4	238	23
≥37 wk.	0	7	353
Total n in GA group*	149	248	380

Abbreviation: FBMR, Finnish Medical Birth Register; GA, gestational age; NFBC, Northern Finland Birth Cohort.

\*Gestational age was missing in 2 subjects after conformation of the gestational age.

Web Table 2. Characteristics of the participants and nonparticipants according to Northern Finland Birth Cohort (NFBC) 1986 and Finnish Medical Birth Register data, Northern Finland 1985-1986 and 2001-2002.

Characteristics	Early preterm		P Value	Late preterm		P Value	Controls		P Value

Physical disability at 16 years, No. (%)†	0 (0.0)	8 (4.3)	0.02	1 (0.4)	6 (1.6)	0.17	1 (0.3)	7 (1.1)	0.17

<sup>a</sup>Means other than height are geometric means and standard deviations (SD). The geometric mean is the n<sup>th</sup> root of the product of n values. Geometric standard deviations correspond to the percentage increase in a variable corresponding to one standard deviation unit change in the logarithm of the variable.

<sup>b</sup> % of the NFBC members.

## WEB APPENDIX: LABORATORY ANALYSES

Plasma glucose (fasting and 2-hour), total cholesterol (TC), high- and low-density lipoprotein cholesterol (HDL-C and LDL-C), triglycerides (TGs), uric acid, alanine aminotransferase (ALT), aspartate transaminase (AST), gamma glutamate, albumin and urea were analyzed by using an Advia 2400 automatic chemical analyzer (Siemens Diagnostics, Terrytown, NY, USA) and blood leucocytes were counted in an automatic electronic cell counter (Abbott CELL-DYN Saphire, Abbott Diagnostics, USA) at Oulu University Hospital laboratory. Serum concentrations of insulin, lipoprotein (a) (LPa), apolipoprotein A1 (ApoA1), apolipoprotein B (ApoB), high-sensitivity C-reactive protein (hsCRP; values >10 mg/l were excluded from analysis), in the Disease Risk Unit of the National Institute for Health and Welfare. The following methods were used: chemiluminescent microparticle immunoassay (CMIA, Abbott Laboratories, USA) for insulin, an immunoturbidimetric method (Abbott Laboratories, USA) for LPa, ApoA1 and ApoB and a latex immunoassay (Sentinel Diagnostics, Italy) for hsCRP. During the course of the measurements the between-batch coefficient of variation in reference samples was <2.9% for insulin, <1.8% for LPa, <1.9% for ApoA1, <3.2% for ApoB and <9.4% for hsCRP. The limit of quantification for the Architect testosterone assay is 0.08 nmol/l. We used a validated calculator program (available at [www.dtu.ox.ac.uk](http://www.dtu.ox.ac.uk)) to define homeostasis model assessment values for insulin resistance (HOMA-IR) from paired fasting glucose and insulin levels.

	4	2.2%	-5.6, 10.6	0.59	0.0%	-6.4, 6.9	0.99	328

Abbreviations: CI, confidence interval; SD, standard deviation.

<sup>a</sup> The geometric mean is the n<sup>th</sup> root of the product of n values. Geometric standard deviation (SD) corresponds to the relative change in a variable corresponding to one standard deviation unit change in the logarithm of the variable. P values are for mean differences between preterm groups and controls.

<sup>b</sup> Multiple regression models are: model 1, adjusted for sex, age and cohort; model 2, adjusted as for model 1 + parental educational attainment, maternal smoking during pregnancy, birth weight SD score, parent's hypertension, diabetes and myocardial infarction /stroke; model 3, adjusted for model 1 + BMI, self-reported physical activity, daily smoking; model 4, adjusted as for model 2 +3; model 5 (women only), adjusted for model 4 + hormonal contraception.
