

S1 Fig. Assessment of the potential endogenous controls. The potential endogenous controls, snRNA:U6, miR26a and miR191, were assessed for amplification efficiency across a range of input miRNA amounts (0.0625 – 1ng). In addition their stability with progression of ALF was assessed using APAP-treated animals (n=3), the comparison of baseline samples at 0h with the diseased samples at ALF + 8h is shown. Values are means \pm SE; Ct, threshold cycle.
