

# Supplementary Figure 1

**a**

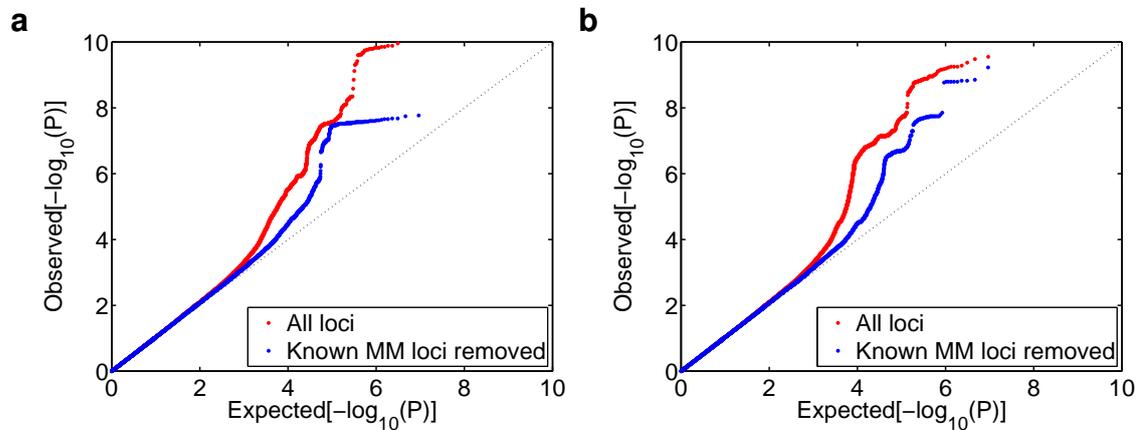

**b**

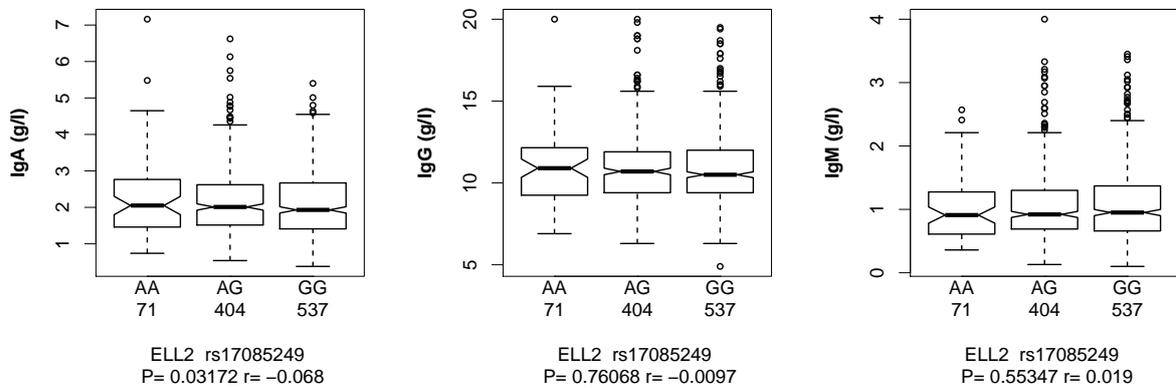

Association plots for MM risk loci identified in previous studies. **(a)** (pages 1 and 2): meta-analysis  $P$  values for the Swedish-Norwegian samples and the Icelandic MM samples. **(b)** (pages 3 and 4): meta-analysis  $P$  values for the Swedish-Norwegian samples and the Icelandic MM+MGUS samples.

## Supplementary Figure 2

Quantile-quantile plots for the meta-analyses of the discovery sets: **(a)** Results obtained with the Swedish-Norwegian data and the Icelandic MM data; **(b)** Results obtained with the Swedish-Norwegian data and the Icelandic MM+MGUS data. A total of 12.1 million SNPs were used in the meta-analyses. Red: results for all SNPs. Blue: results after removing SNPs belonging to MM risk loci discovered in previous association studies (**Supplementary Fig. 1** and **Supplementary Table 1**). We observed minimal inflation of meta-analysis  $P$  values (genomic inflation factor  $\lambda=1.005$  and  $1.020$  for the two meta-analyses, respectively).

## Supplementary Figure 3

Blood concentrations of IgA, IgG and IgM values per genotype in 1,012 Swedish blood donors. These donors were genotyped previously for rs17085249, which is in tight linkage disequilibrium with the *ELL2* sentinel SNP rs56219066 ( $r^2=0.95$ ). Boxes indicate medians and the first and third quartiles. Whiskers indicate first and third quartiles  $\pm 1.5$  times the interquartile range or the minimum/maximum values. Notches indicate confidence intervals around the median. Pearson correlation  $P$  values indicated.

Association results for *ELL2* rs56219066, *TOM1* rs138740, and *ARHGAP26* rs74735889 in the meta-analyses of the Swedish-Norwegian and Icelandic discovery samples. †By direct genotyping of the Swedish case and control samples the signal at 5q31 was no longer significant (OR=1.69;  $P=0.014$ ). Abbreviations: EAF, effect allele frequency; OR, odds ratio. Logistic regression and meta-analysis P values indicated.
