^a in mature form (without a transite peptide)

^b Two *psbO* sequences of *S. moellendorffii* can be found in EST databases. One of them (PlantGDB: PUT-165a-Selaginella_moellendorffii-12671) has far different mutation rate and seems to be a slightly expressed pseudogene, thus was omitted from analyses.

^c Two isoforms of *T. halophila* that are most similar to isoforms of *A. thaliana* have only 10 different amino acid residues, another, the most diverged isoform, is orthologous to a truncated pseudogene of *A. thaliana*.

^d *L. usitatissimum* expresses two *psbO* genes, but the corresponding mature proteins have the same amino acid sequence.
