

Figure S3. Ocular phenotype observed in GFP-AP-2 δ -injected embryos is caused by AP-2 δ mis-expression within the retina. Retina tissue sections from E5 embryos *in ovo* electroporated with a GFP-AP2 δ RCAS expression construct were immunostained with anti-GFP antibody, followed by secondary antibody conjugated to Alexa 488. Nuclei were labeled with DAPI. Photographs were taken with a Zeiss LSM710 confocal microscope equipped with a 10X lens. Scale bar = 500 μ m.
