

S2 Table – Estimated ages for all nodes obtained in the separate and in the combined analyses

S2 Table. Estimated ages for all nodes obtained in the separate and in the combined analyses. Credibility intervals are indicated by 95% highest probability density (HPD) for each node. Node numbers sometimes differ between the two analyses but estimates given on the same row concern the same group of taxa in each of the analyses. Nodes present in the results of one of the analysis, but with no correspondence in the other, are indicated with nc. Node numbers in the separate analysis refer to numbered nodes in (Figs. 1 and 2) and node numbers in the combined analysis refer to numbered nodes in (Figs. 3 and 4). Node 42 (Gentianales crown group) and nodes 110, 111, and 112 all have two age estimates reported from the separate analysis, one from the asterid analysis and one from the analysis of the Gentianales.

Ages from the separate analysis (Figs. 1 and 2)				Ages from the combined analysis (Figs. 3 and 4)
