

Figure S6. Flow cytometry analysis of zebrafish leukocytes using isotype control compared to cells stained only secondary Ab. (A) FITC conjugated anti rabbit secondary antibody was used here and bar was set to allow for 1 % auto-fluorescence cells (false-positives). (B) 1 in 200 dilution of pre-immunized rabbit sera was used as an isotype control and the bar setting strategy in this plot was then used for the zfCD4-1 anti rabbit polyclonal antibody for further experiments.
