

Supplementary data for:

Expression of potato RNA binding proteins, *StUBA2a/b* and *StUBA2c*, induces early senescence in *Arabidopsis*

Jong-Kuk Na, Jae-Kwang Kim, Dool-Yi Kim, Sarah M. Assmann

Supplementary Table S1. List of primers used in this study.

No	Primer ID	Primer sequences (5' → 3')	Comments
1	StUBA2a/b-F	CCAAATCAGAAAACCTAATTCA	Cloning to PCR™-Blunt II-TOPO
2	StUBA2a/b-R	ACTTGGAAAGTAGAGCCATAGCATT	Cloning to PCR™-Blunt II-TOPO
3	StUBA2c-F	TCTTCTCTGAGCGAAAATGGA	Cloning to PCR™-Blunt II-TOPO

* Bold numbers with underline denote amino acid length of the corresponding protein.

Top lines with percentage denote aligned sequence identity and bottom lines indicate identical sequence length.

Supplementary Table S3. Characteristics of genes used for expression assays.

Locus ID	Gene/protein	Full name	Senescence type	Defense (cell death)	Pathway	Regulation by StUBA2a/b
At4g35890	LARP1c	La Related protein 1c	Age-dependent senescence	N/A	Senescence	no effect
At5g45890	SAG12	Senescence-Associated gene 12	Age-dependent senescence	N/A	Senescence	no effect
At2g29350	SAG13	Senescence-Associated gene 13	Age-dependent senescence	N/A	Senescence	upregulated
At1g62300	WRKY6	WRKY transcription factor 6	Age-dependent senescence	Plant defense	Senescence/Pathogen defense	slightly upregulated
At5g66100	LARP1b	La Related protein 1b	Age-dependent senescence	N/A	Senescence	no effect
At5g39610	ORE1	Oresara 1	Age-dependent senescence	N/A	Senescence	upregulated
At2g27150	AAO3	Abscisic aldehyde oxidase 3	Age-dependent senescence	N/A	ABA biosynthesis	slightly upregulated
At5g03280	EIN2	Ethylene insensitive 2	Age-dependent senescence	N/A	Ethylene signaling/stress response	no effect
At1g50030	AtTOR	Target of rapamycin	Accelerated senescence	N/A	Autophagy	no effect
At4g04620	AtATG8b	Autophagy 8B	Accelerated senescence	N/A	Autophagy	upregulated
At2g45170	AtATG8e	Autophagy 8E	Accelerated senescence	N/A	Autophagy	upregulated
At4g16520	AtATG8f	Autophagy 8F	Accelerated senescence	N/A	Autophagy	no effect
At3g15580	AtATG8h	Autophagy 8H	Accelerated senescence	N/A	Autophagy	slightly upregulated
At3g62770	AtATG18a	Autophagy 18A	Accelerated senescence	N/A	Autophagy/stress response	no effect
At2g31260	AtATG9	Autophagy 9	Accelerated senescence	Plant defense	Autophagy	slightly upregulated
At4g11280	ACS6	1-aminocyclopropane-1-carboxylate synthase 6	Ethylene-induced senescence	N/A	Ethylene biosynthesis	upregulated

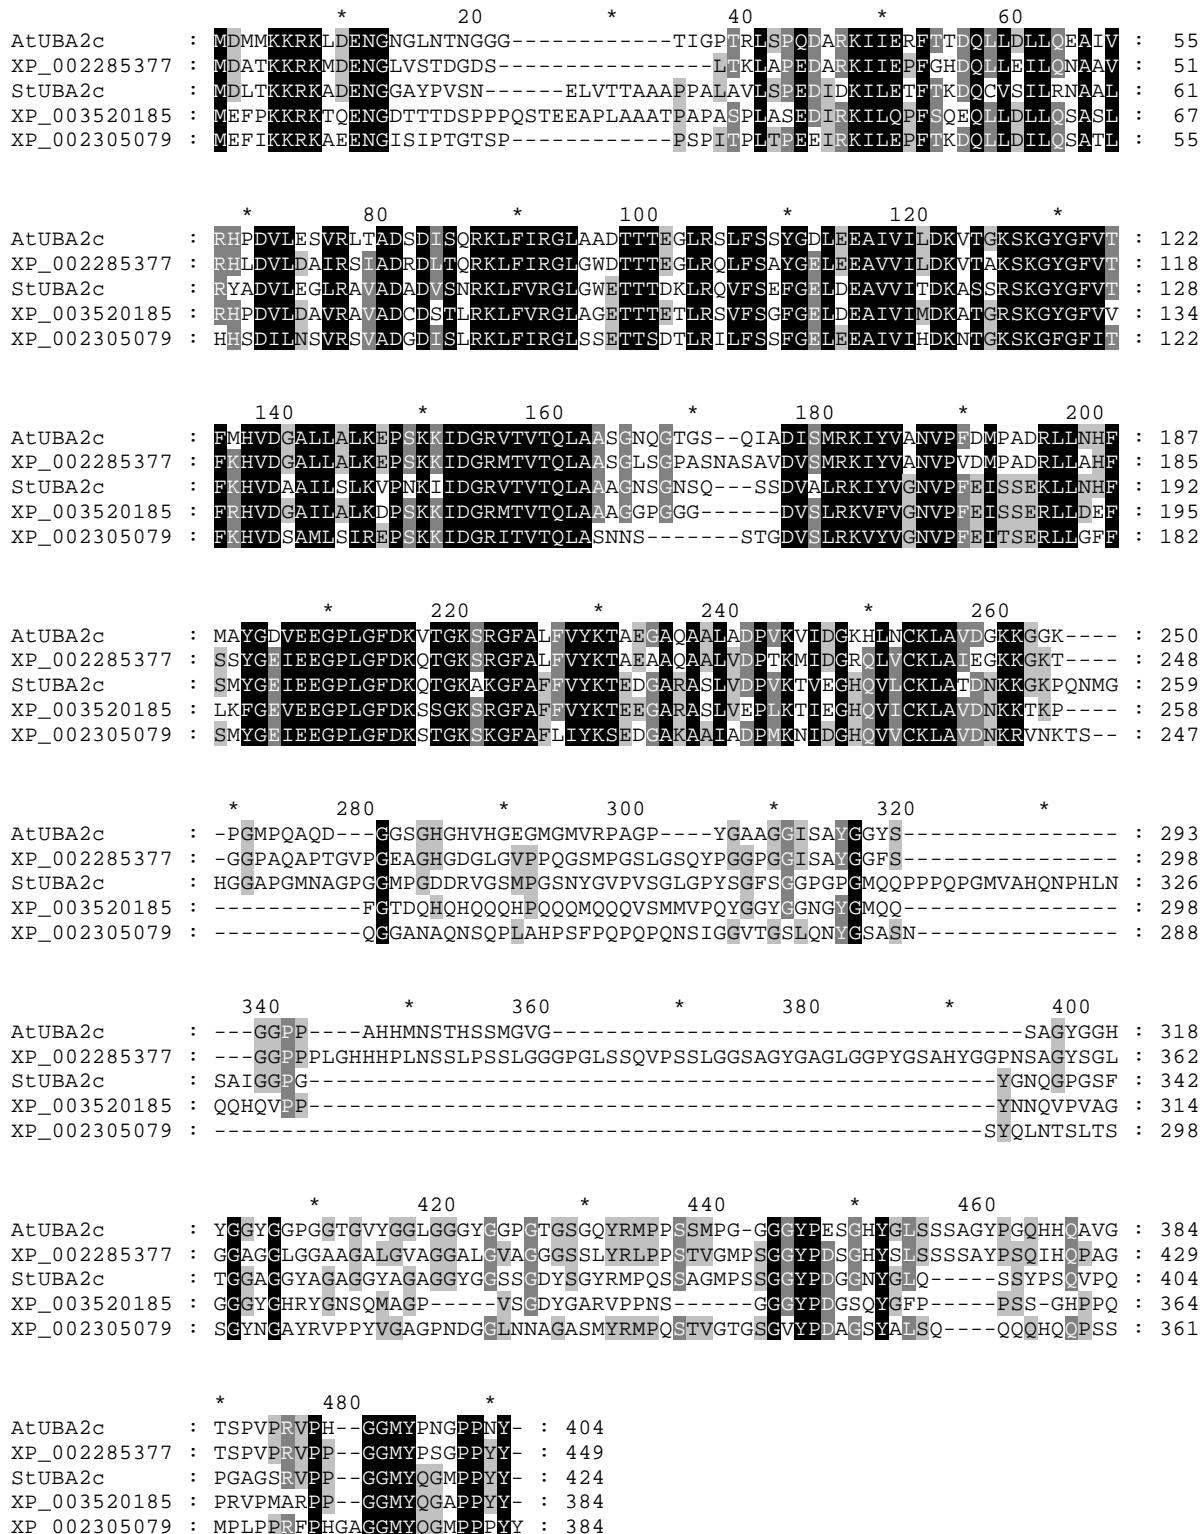

At2g19190	SIRK	Senescence-induced receptor-like kinase	Leaf senescence	N/A	Senescence	upregulated
At5g50200	WR3	Wound-Responsive 3	Leaf senescence	Plant defense	Wounding response	upregulated

B.

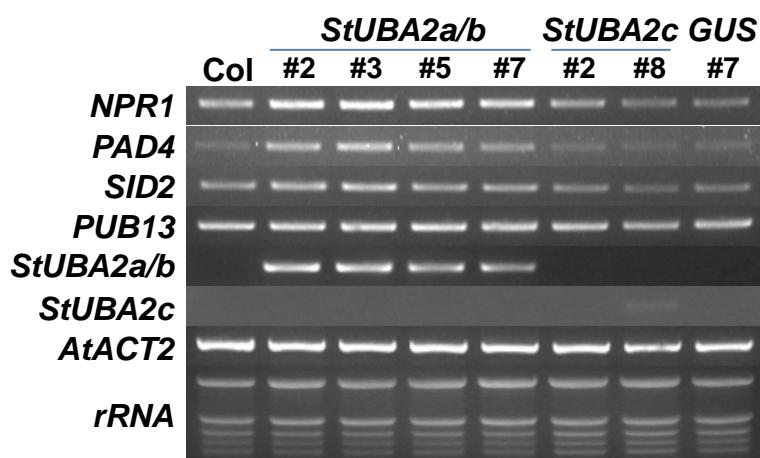

Supplementary Figure S1. Alignment of full-length potato StUBA2s with homologous proteins in several plant species. **A.** StUBA2a/b and its homologous proteins. **B.** StUBA2c and its homologous proteins.

A**B**

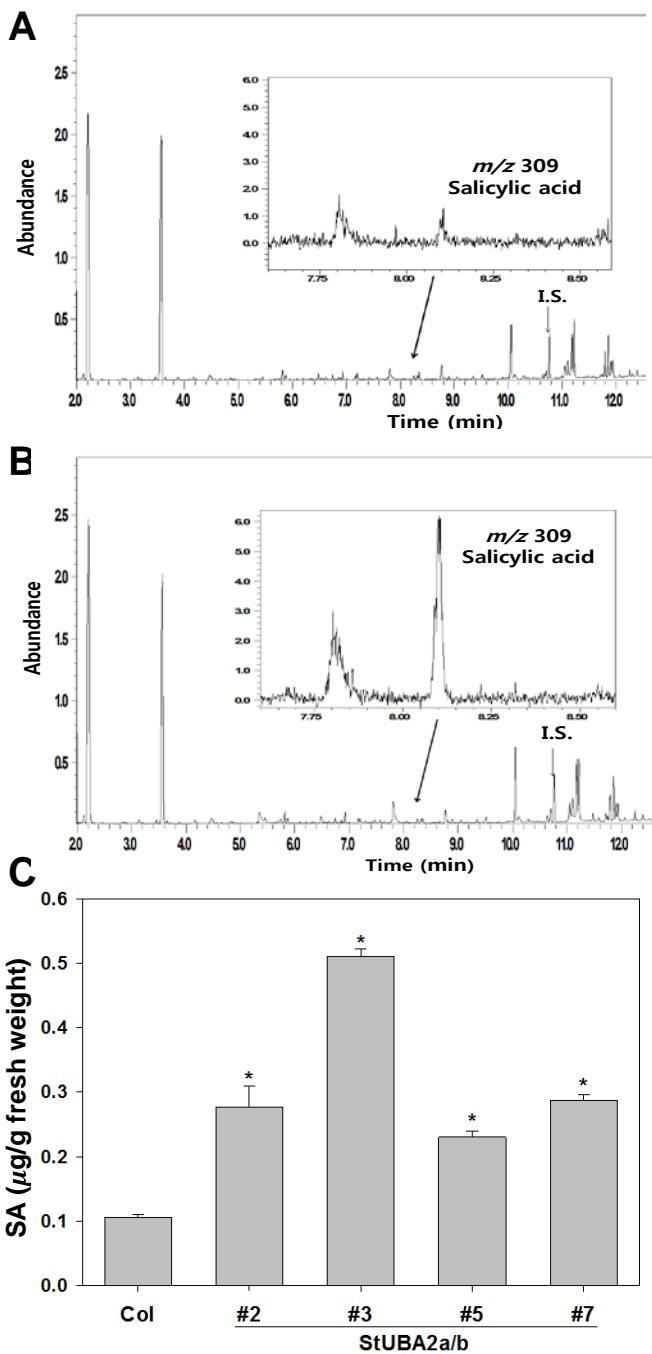

Supplementary Figure S2. Early leaf senescence of *35S:StUBA2a/b* plants grown aseptically in magenta boxes, or in soil. **A.** Senescing phenotype observed in six-week-old T3 *35S:StUBA2a/b* plants in MS media. # numbers refer independent transgenic lines. Each T3 transgenic line was germinated in MS plate containing kanamycin and then kanamycin-resistant plants were transferred to antibiotic-free MS media. **B.** Senescing phenotype observed only in two-month-old T2 transgenic plants grown in soil at growth chamber. These plants are the same as those shown in Fig. 3A, but at a later developmental stage. Numbers indicate individual T2 plants from either *35S:StUBA2a/b* #3 or *35S:StUBA2a/b* #7.

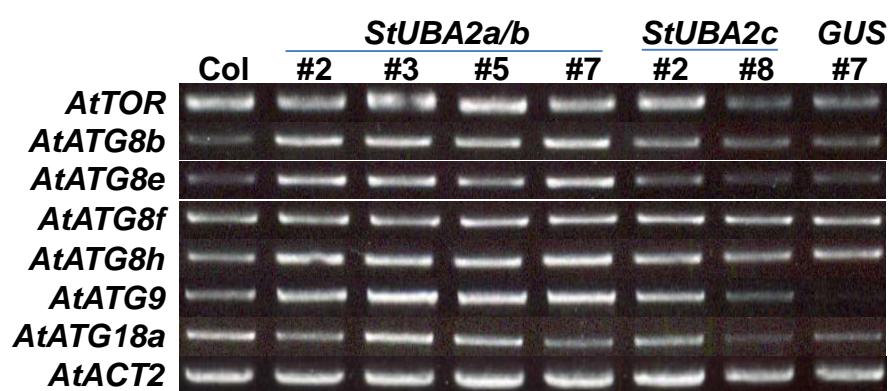

Supplementary Figure S3. Transcript levels of *LARP1* RBP family are not altered by the overexpression of *StUBA2a/b*.

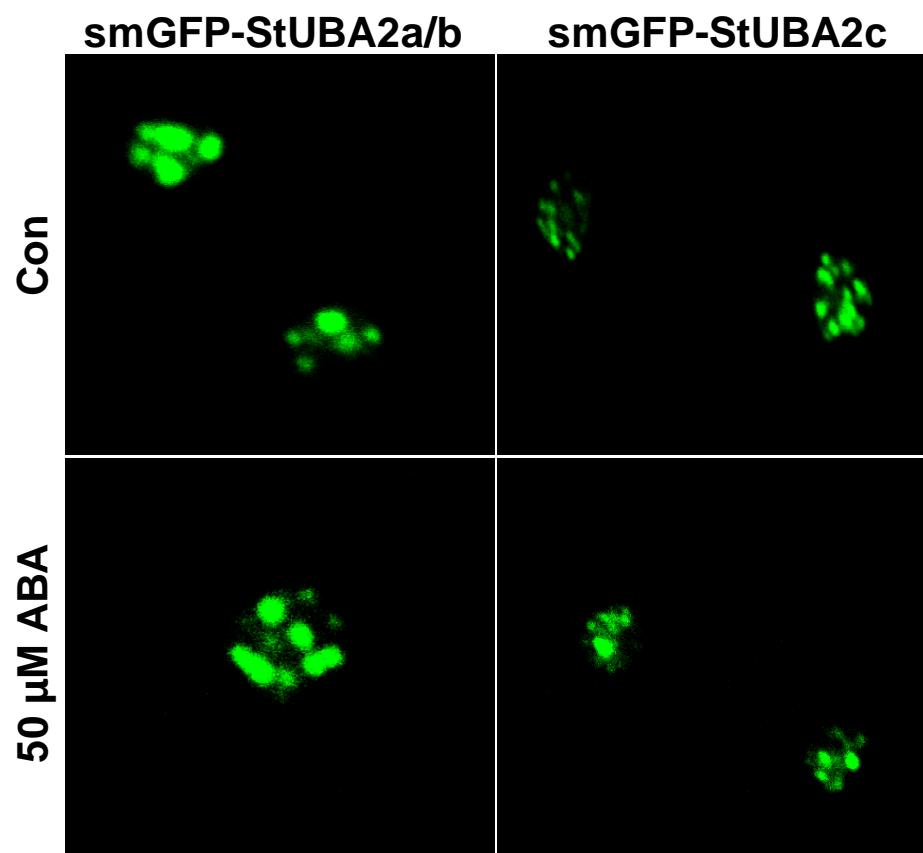

Supplementary Figure S4. Elevated transcript levels of genes involved in SA signaling or biosynthesis in T3 35S:*StUBA2a/b* plants. RT-PCR was carried out using gene specific primers (Supplementary Table S1). Among *StUBA2a/b* transgenic lines, #2, #3, and #7 lines were heterozygous, and #5 was homozygous. *StUBA2c* #2 and #8 and *GUS* #7 lines were homozygous. *GUS* #7 line was used as vector control.

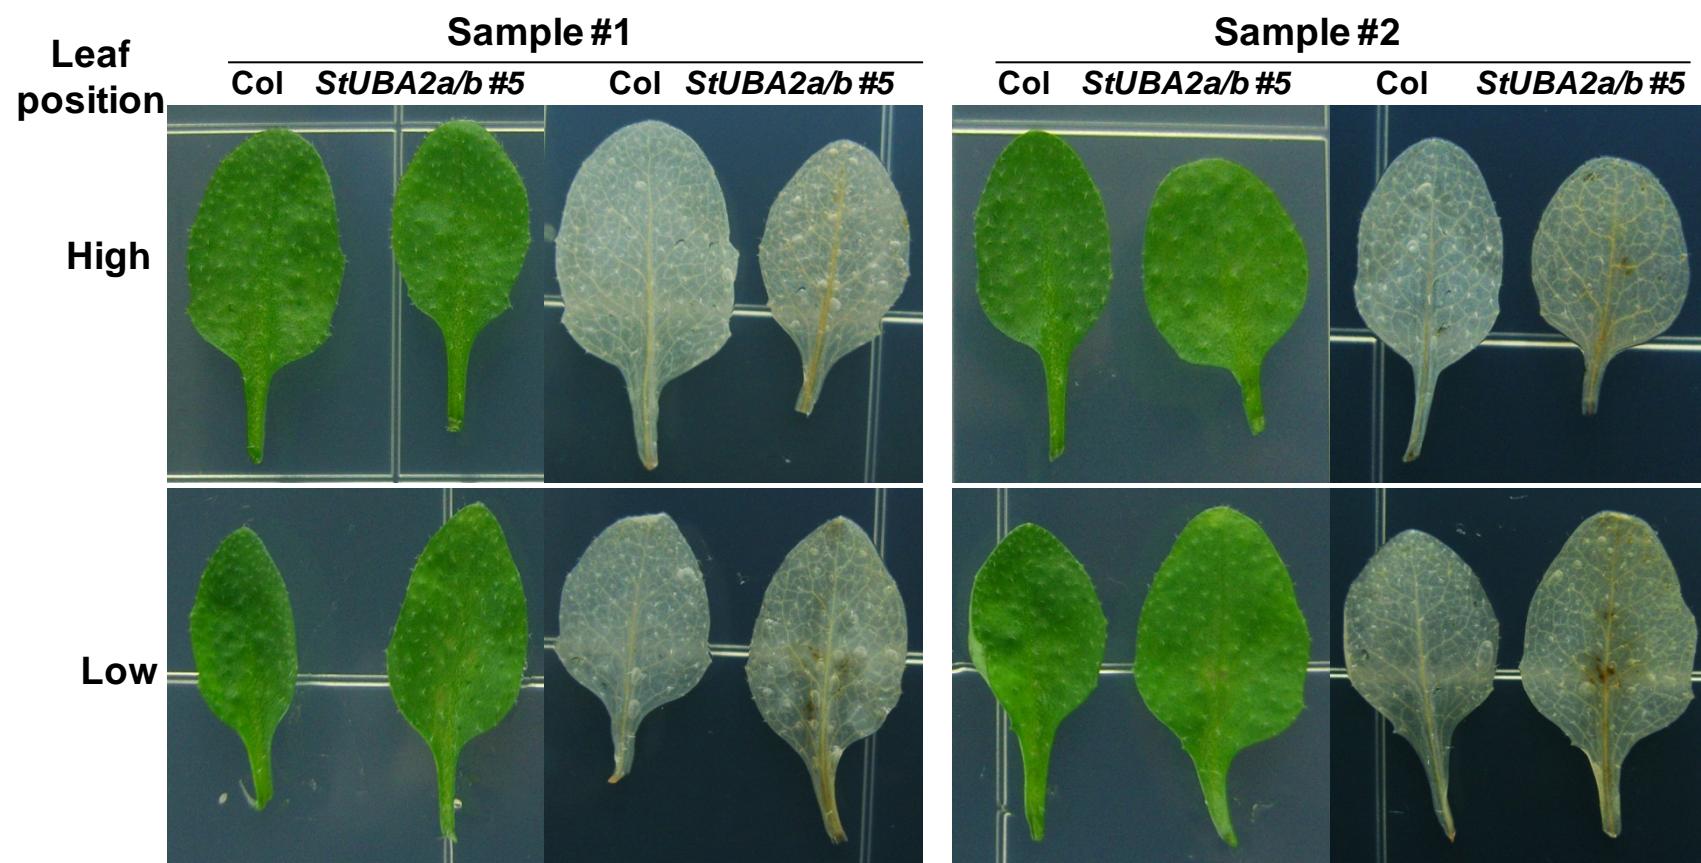

Supplementary Figure S5. SA content in three-week-old 35S:*StUBA2a/b* and wild type plants grown in MS media under $120 \mu\text{mol}^{-1} \text{m}^{-2}$ light with 16/8 light/dark conditions. Representative total ion chromatogram of SA extracted from Col (A) and *StUBA2a/b* #3 (B) as TBDMS derivatives separated on a $30 \text{ m} \times 0.25 \text{ mm}$ i.d. fused-silica capillary column coated with $0.25\text{-}\mu\text{m}$ CP-SIL 8 CB low bleed. The upper trace was recorded in SIM mode (m/z 309, quantification ion of SA). Internal Standard (I.S.) 3,4,5-trimethoxycinnamic acid. C. SA contents in the given genotypes. Asterisk indicates a significant difference at $P < 0.05$.

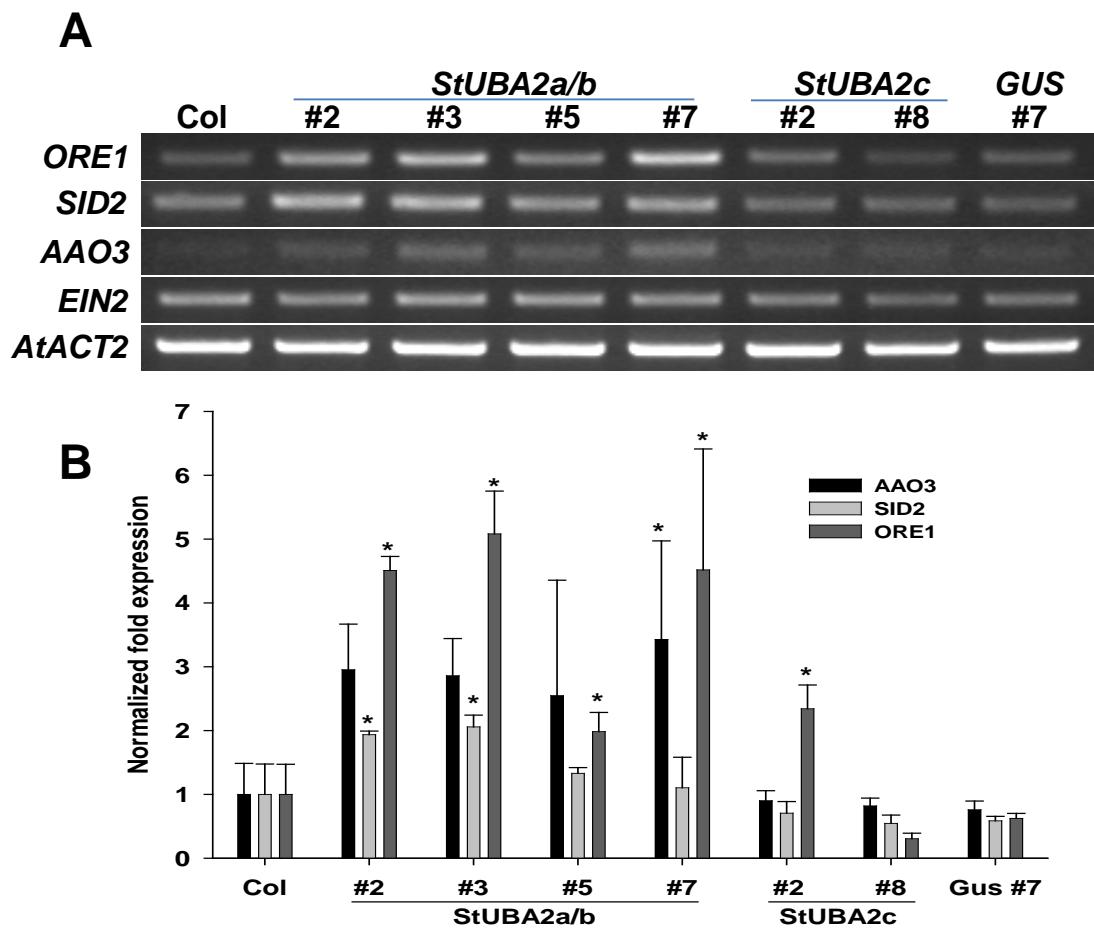

Supplementary Figure S6. Altered expression of autophagy-associated genes in 35S:*StUBA2a/b* transgenic plants. RT-PCR was carried out using autophagy-associated gene specific primers (Supplementary Table S1).

Supplementary Figure S7. smGFP-StUBA2s did not relocalize with exogenous ABA application.

Supplementary Figure S8. H₂O₂ accumulation in the young or old leaves of 35S:*StUBA2a/b* transgenic plants.

Supplementary Figure S9. Age-dependent leaf senescence marker gene *ORE1* is upregulated by the overexpression of *StUBA2a/b*. # numbers refer to independent T3 lines. **A.** RT-PCR analysis of *ORE1*, *SID2*, *AAO3*, and *EIN2* genes. **B.** qRT-PCR analysis of *AAO3*, *SID2*, and *ORE1* gene. Transcript level of *Actin2* gene was used as reference. Asterisk indicates a significant difference at $P < 0.05$.
