

Elevated Src family kinase activity stabilizes E-cadherin-based junctions and collective movement of head and neck squamous cell carcinomas

Supplementary Material

Supplemental Figure 1: Effect of cell density on SFK phosphorylation. Western blot of lysates of CAL33 and CAL27 cells plated at increasing density for 36h. ERK1/2 expression is shown as loading control.

Supplemental Figure 2: Effect of cell-cell adhesion on SFK phosphorylation : Calcium switch assay. (top) Immunostaining of E-cadherin and phospho-SFK in CAL33 cells at the indicated times after switching cells from a Ca²⁺-deprived to Ca²⁺ containing medium (bar=15µm). **(bottom)** Western blot analysis of SFK phosphorylation of CAL33 cell lysates following the Ca²⁺ switch. Erk1/2 is visualized as loading control.

Supplemental Figure 3: Similar organization of cohesive E-cadherin-positive CAL27 cell-derived tumor cell strands on cell-derived matrix and in vivo. (A) CAL27 cells were plated on non-coated culture plates (left) or cell-derived matrix (right). Phase contrast images (bar=150 μ m) are shown. (B) Immunohistochemical staining of Src and E-cadherin in FFPE sections of CAL27-derived tumors isolated from mice (bar=200 μ m).
