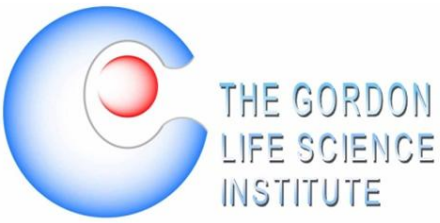
Pse-in-One: a web server for generating various modes of pseudo components of DNA, RNA, and protein sequences

2015-04-08

Home-page: http://bioinformatics.hitsz.edu.cn/Pse-in-One/



Content

1. DNA

1.1 Deoxyribonucleic acid composition

1.1.1 Basic kmer (Kmer)

Basic kmer (1) is the simplest approach to represent the DNAs, in which the DNA sequences are represented as the occurrence frequencies of *k* neighboring nucleic acids. This approach has been successfully applied to human gene regulatory sequence prediction (2,3), enhancer identification (1), etc.

1.1.2 Reverse complementary kmer (RevKmer)

The reverse complementary kmer (2,3) is a variant of the basic kmer, in which the kmers are not expected to be strand-specific, so reverse complements are collapsed into a single feature. For example, if *k*=2, there are totally 16 basic kmers ('AA', 'AC', 'AG', 'AT', 'CA', 'CC', 'CG', 'CT', 'GA', 'GC', 'GG', 'GT', 'TA', 'TC', 'TG', 'TT'), but by removing the reverse complementary kmers, there are only 10 distinct kmers in the reverse complementary kmer approach ('AA', 'AC', 'AG', 'AT', 'CA', 'CC', 'CG', 'GA', 'GC', 'TA'). For more information of this approach, please refer to (2,3).

1.2 Autocorrelation

1.2.1 Dinucleotide-based auto covariance (DAC)

Suppose a DNA sequence **D** with *L* nucleic acid residues; i.e.

$$\mathbf{D} = \mathrm{R}_1\mathrm{R}_2\mathrm{R}_3\mathrm{R}_4\mathrm{R}_5\mathrm{R}_6\mathrm{R}_7\cdots\mathrm{R}_L \tag{1}$$

where R_1 represents the nucleic acid residue at the sequence position 1, R_2 the nucleic acid residue at position 2 and so forth.

The DAC (4-6) measures the correlation of the same physicochemical index between two dinucleotides separated by a distance of *lag* along the sequence, which can be calculated as:

$$\mathrm{DAC}(u, lag) = \sum_{i=1}^{L-lag-1} (P_u(\mathrm{R}_i\mathrm{R}_{i+1}) - \overline{P}_u)(P_u(\mathrm{R}_{i+lag}\mathrm{R}_{i+lag+1}) - \overline{P}_u) / (L - lag - 1) \tag{2}$$

where *u* is a physicochemical index, *L* is the length of the DNA sequence, $P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ means the numerical value of the physicochemical index *u* for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ at position *i*, $\overline{P}_u$ is the average value for physicochemical index *u* along the whole sequence:

$$\overline{P_u} = \sum_{j=1}^{L-1} P_u(\mathrm{R}_j\mathrm{R}_{j+1}) / (L-1) \tag{3}$$

In such a way, the length of DAC feature vector is $N*\mathrm{LAG}$, where N is the number of physicochemical indices (**Table 1**) extracted from two papers (6,7), and LAG is the maximum of *lag* (*lag* = 1, 2, … , LAG).

1.2.2 Dinucleotide-based cross covariance (DCC)

Given a DNA sequence **D** (**Eq. 1**), the DCC (4,6) approach measures the correlation of two different physicochemical indices between two dinucleotides separated by *lag* nucleic acids along the sequence, which can be calculated by:

$$\mathrm{DCC}(u_1,u_2,lag) = \sum_{i=1}^{L-lag-1} (P_{u_1}(R_iR_{i+1}) - \overline{P}_{u_1})(P_{u_2}(R_{i+lag}R_{i+lag+1}) - \overline{P}_{u_2}) / (L - lag - 1) \quad (4)$$

where u_1, u_2 are two different physicochemical indices, L is the length of the DNA sequence, $P_{u_1}(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_{u_2}(\mathrm{R}_i\mathrm{R}_{i+1})$) is the numerical value of the physicochemical index u_1 (u_2) for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ at position i, $\overline{P}_{u_1}$ ($\overline{P}_{u_2}$) is the average value for physicochemical index value u_1(u_2) along the whole sequence:

$$\overline{P_u} = \sum_{j=1}^{L-1} P_u(\mathrm{R}_j\mathrm{R}_{j+1}) / (L-1) \quad (5)$$

In such a way, the length of the DCC feature vector is N*(N-1)*LAG, where LAG is the maximum of *lag* (*lag*=1, 2, …, LAG); N is the number of physicochemical indices (**Table 1**).

1.2.3 Dinucleotide-based auto-cross covariance (DACC)

DACC (4,6) is a combination of DAC and DCC. Therefore, the length of the DACC feature vector is N*N*LAG, where N is the number of physicochemical indices (**Table 1**) and LAG is the maximum of *lag* (*lag* = 1, 2, …, LAG).

1.2.4 Trinucleotide-based auto covariance (TAC)

Given a DNA sequence **D** (**Eq. 1**), the TAC approach (4-6) measures the correlation of the same physicochemical index between two trinucleotides separated by *lag* nucleic acids along the sequence, which can be calculated as:

$$\mathrm{TAC}(lag,u) = \sum_{i=1}^{L-lag-2} (P_u(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}) - \overline{P}_u)(P_u(\mathrm{R}_{i+lag}\mathrm{R}_{i+lag+1}\mathrm{R}_{i+lag+2}) - \overline{P}_u) / (L - lag - 2) \quad (6)$$

where u is a physicochemical index, L is the length of the DNA sequence, $P_u(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2})$ represents the numerical value of the physicochemical index u for the trinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}$ at position i, $\overline{P}_u$ is the average value for physicochemical index u along the whole sequence:

$$\overline{P_u} = \sum_{j=1}^{L-2} P_u(\mathrm{R}_j\mathrm{R}_{j+1}\mathrm{R}_{j+2}) / (L-2) \quad (7)$$

In such a way, the length of TAC feature vector is $N*$LAG, where N is the number of physicochemical indices (**Table 2**) extracted from (6), and LAG is the maximum of *lag* (lag=1, 2, …, LAG).

1.2.5 Trinucleotide-based cross covariance (TCC)

Given a DNA sequence **D** (**Eq. 1**), the TCC (4,6) approach measures the correlation of two different physicochemical indices between two trinucleotides separated by *lag* nucleic acids along the sequence, which can be calculated by:

$$\mathrm{TCC}(u_1,u_2,\mathrm{lag}) = \sum_{i=1}^{L-lag-2} (P_{u_1}(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}) - \overline{P}_{u_1})(P_{u_2}(\mathrm{R}_{i+lag}\mathrm{R}_{i+lag+1}\mathrm{R}_{i+lag+2}) - \overline{P}_{u_2}) / (L\text{-}lag\text{-}2) \quad (8)$$

where u_1, u_2 are two physicochemical indices; L is the length of the DNA sequence; $P_{u_1}(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2})$ ($P_{u_2}(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2})$) represents the numerical value of the physicochemical index u_1 (u_2) for the trinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ R_{i+2} at position i; $\overline{P}_{u_1}$ ($\overline{P}_{u_2}$) is the average value for physicochemical index u_1 (u_2) along the whole sequence:

$$\overline{P_u} = \sum_{j=1}^{L-2} P_u(\mathrm{R}_j\mathrm{R}_{j+1}\mathrm{R}_{j+2}) / (L-2) \quad (9)$$

In such a way, the length of TCC feature vector is $N*(N-1)*$LAG, where N is the number of physicochemical index (**Table 2**) extracted from (6), and LAG is the maximum of *lag* (lag = 1, 2, …, LAG).

1.2.6 Trinucleotide-based auto-cross covariance (TACC)

TACC (4,6) is a combination of TAC and TCC. Therefore, the length of the TACC feature vector is $N*N*$LAG, where N is the number of physicochemical indices (**Table 2**) extracted from (6), and LAG is the maximum of *lag* (lag = 1, 2, …, LAG).

1.3 Pseudo deoxyribonucleic acid composition

1.3.1 Pseudo dinucleotide composition (PseDNC)

PseDNC (8) is an approach incorporating the contiguous local sequence-order information and the global sequence-order information into the feature vector of the DNA sequence.

Given a DNA sequence **D** (**Eq. 1**), the PseDNC feature vector of **D** is defined:

$$\mathbf{D} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{16} & d_{16+1} & \cdots & d_{16+\lambda} \end{bmatrix}^{\mathbf{T}} \quad (10)$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (1 \le k \le 16) \\ \dfrac{w\theta_{k-16}}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (17 \le k \le 16+\lambda) \end{cases} \tag{11}$$

where f_k (k=1,2,⋯,16) is the normalized occurrence frequency of dinucleotides in the DNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a DNA sequence; w is the weight factor ranged from 0 to 1; θ_j (j=1,2,⋯,λ) is called the j-tier correlation factor that reflects the sequence-order correlation between all the most j-tier contiguous dinucleotides along a DNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+1}\mathrm{R}_{i+2}) \\ \theta_2 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+2}\mathrm{R}_{i+3}) \\ \theta_3 = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+3}\mathrm{R}_{i+4}) \qquad (\lambda < L) \\ \cdots\cdots \\ \theta_\lambda = \dfrac{1}{L\text{-}1\text{-}\lambda}\sum_{i=1}^{L-1-\lambda}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+\lambda}\mathrm{R}_{i+\lambda+1}) \end{cases} \tag{12}$$

where the correlation function is given by

$$\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_j\mathrm{R}_{j+1}) = \frac{1}{\mu}\sum_{u=1}^{\mu}[P_u(\mathrm{R}_i\mathrm{R}_{i+1}) - P_u(\mathrm{R}_j\mathrm{R}_{j+1})]^2 \tag{13}$$

where μ is the number of physicochemical indices, in this approach, 6 indices reflecting the local DNA structural properties (8) (**Table 3**) are employed to generate the PseDNC feature vector; $P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_u(\mathrm{R}_j\mathrm{R}_{j+1})$) represents the numerical value of the u-th ($u = 1,2,\cdots,\mu$) physicochemical index of the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ ($\mathrm{R}_j\mathrm{R}_{j+1}$) at position i (j).

1.3.2 Pseudo *k*-tuple nucleotide composition (PseKNC)

PseKNC (9,10) extends the PseDNC approach by incorporating k-tuple nucleotide composition.

Given a DNA sequence **D** (**Eq. 1**), the feature vector of **D** is defined:

$$\mathbf{D} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{4^k} & d_{4^k+1} & \cdots & d_{4^k+\lambda} \end{bmatrix}^{\mathbf{T}} \tag{14}$$

where

$$d_u = \begin{cases} \dfrac{f_u}{\sum_{i=1}^{4^k} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (1 \le u \le 4^k) \\ \dfrac{w\theta_{u-4^k}}{\sum_{i=1}^{4^k} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (4^k \le u \le 4^k + \lambda) \end{cases} \quad (15)$$

where λ is the number of the total counted ranks (or tiers) of the correlations along a DNA sequence; f_u (u=1,2,⋯,4^k) is the frequency of oligonucleotide that is normalized to $\sum_{i=1}^{4^k} f_i = 1$; w is a weight factor; θ_j is given by

$$\theta_j = \frac{1}{L\text{-}j\text{-}1}\sum_{i=1}^{L-j-1}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+j}\mathrm{R}_{i+j+1}) \quad (j = 1, 2, \cdots, \lambda; \lambda < L) \quad (16)$$

which represents the j-tier structural correlation factor between all the j-th most contiguous dinucleotides. The correlation function $\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+j}\mathrm{R}_{i+j+1})$ is defined by

$$\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+j}\mathrm{R}_{i+j+1}) = \frac{1}{\mu}\sum_{v=1}^{\mu}[P_v(\mathrm{R}_i\mathrm{R}_{i+1}) - P_v(\mathrm{R}_{i+j}\mathrm{R}_{i+j+1})]^2 \quad (17)$$

where μ is the number of physicochemical indices, in this study, 6 indices reflecting the local DNA structural properties (8) (**Table 3**) are employed to generate the PseKNC feature vector; $P_v(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_v(\mathrm{R}_{i+j}\mathrm{R}_{i+j+1})$) represents the numerical value of the v-th ($v = 1,2,\cdots,\mu$) physicochemical index for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ ($\mathrm{R}_{i+j}\mathrm{R}_{i+j+1}$) at position i (i+j).

For more information about this approach, please refer to (9,10).

1.3.3 General parallel correlation pseudo dinucleotide composition (PC-PseDNC-General)

In PC-PseDNC-General (11) approach, the users cannot only select the 148 built-in physiochemical indices (**Table 1**), but also can upload their own indices to generate the PC-PseDNC-General feature vector.

Given a DNA sequence **D** (**Eq. 1**), the PC-PseDNC-General feature vector of **D** is defined:

$$\mathbf{D} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{16} & d_{16+1} & \cdots & d_{16+\lambda} \end{bmatrix}^{\mathbf{T}} \quad (18)$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (1 \le k \le 16) \\ \dfrac{w\theta_{k-16}}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (16+1 \le k \le 16+\lambda) \end{cases} \quad (19)$$

where f_k（k=1,2,⋯,16) is the normalized occurrence frequency of dinucleotides in the DNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a DNA sequence; w is the weight factor ranging from

0 to 1; θ_j (j=1, 2, ⋯, λ) is called the j-tier correlation factor that reflects the sequence-order correlation between all the most contiguous dinucleotides along a DNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+1}\mathrm{R}_{i+2}) \\ \theta_2 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+2}\mathrm{R}_{i+3}) \\ \theta_3 = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+3}\mathrm{R}_{i+4}) \qquad (\lambda < L-1) \\ \cdots\cdots \\ \theta_\lambda = \dfrac{1}{L\text{-}1\text{-}\lambda}\sum_{i=1}^{L-1-\lambda}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+\lambda}\mathrm{R}_{i+\lambda+1}) \end{cases} \tag{20}$$

where the correlation function is given by

$$\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_j\mathrm{R}_{j+1}) = \frac{1}{\mu}\sum_{u=1}^{\mu}[P_u(\mathrm{R}_i\mathrm{R}_{i+1}) - P_u(\mathrm{R}_j\mathrm{R}_{j+1})]^2 \tag{21}$$

where μ is the number of physicochemical indices listed in the **Table 1**; $P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_u(\mathrm{R}_j\mathrm{R}_{j+1})$) represents the numerical value of the u-th ($u = 1,2,\cdots,\mu$) physicochemical index for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ ($\mathrm{R}_j\mathrm{R}_{j+1}$) at position i (j).

1.3.4 General parallel correlation pseudo trinucleotide composition (PC-PseTNC-General)

In PC-PseTNC-General (11) approach, the users cannot only select the 12 built-in physiochemical indices (**Table 2**), but also can upload their own indices to generate the PC-PseTNC-General feature vector.

Given a DNA sequence **D** (**Eq. 1**), the PC-PseTNC-General feature vector of **D** is defined:

$$\mathbf{D} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{64} & d_{64+1} & \cdots & d_{64+\lambda} \end{bmatrix}^{\mathrm{T}} \tag{22}$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{64} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (1 \le k \le 64) \\ \dfrac{w\theta_{k-64}}{\sum_{i=1}^{64} f_i + w\sum_{j=1}^{\lambda}\theta_j} & (64\text{+}1 \le k \le 64+\lambda) \end{cases} \tag{23}$$

where f_k（k=1,2,⋯,64) is the normalized occurrence frequency of trinucleotide in the DNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a DNA sequence; w is the weight factor ranging from 0 to 1; θ_j (j=1, 2, ⋯, λ) is called the j-tier correlation factor that reflects the sequence-order correlation between all the most contiguous trinucleotides along a DNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2},\mathrm{R}_{i+1}\mathrm{R}_{i+2}\mathrm{R}_{i+3}) \\ \theta_2 = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2},\mathrm{R}_{i+2}\mathrm{R}_{i+3}\mathrm{R}_{i+4}) \\ \theta_3 = \dfrac{1}{L\text{-}5}\sum_{i=1}^{L-5}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2},\mathrm{R}_{i+3}\mathrm{R}_{i+4}\mathrm{R}_{i+5}) \\ \cdots\cdots \\ \theta_\lambda = \dfrac{1}{L\text{-}2\text{-}\lambda}\sum_{i=1}^{L-2-\lambda}\Theta(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2},\mathrm{R}_{i+\lambda}\mathrm{R}_{i+\lambda+1}\mathrm{R}_{i+\lambda+2}) \end{cases} \quad (\lambda < L-2) \tag{24}$$

where the correlation function is given by

$$\Theta(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2},\mathrm{R}_j\mathrm{R}_{j+1}\mathrm{R}_{j+2}) = \frac{1}{\mu}\sum_{u=1}^{\mu}[P_u(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}) - P_u(\mathrm{R}_j\mathrm{R}_{j+1}\mathrm{R}_{j+2})]^2 \tag{25}$$

where μ is the number of physicochemical indices considered that are listed in the **Table 2**; $P_u(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2})$ ($P_u(\mathrm{R}_j\mathrm{R}_{j+1}\mathrm{R}_{j+2})$) represents the numerical value of the *u*-th ($u = 1, 2, \cdots, \mu$) physicochemical index for the tri-nucleotide $\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}$ ($\mathrm{R}_j\mathrm{R}_{j+1}\mathrm{R}_{j+2}$) at position *i* (*j*).

1.3.5 General series correlation pseudo dinucleotide composition (SC-PseDNC-General)

SC-PseDNC-General (11) is a variant of PC-PseDNC-General, which differs in the equations of calculating the correlation factors reflecting the sequence-order correlation between all the most contiguous dinucleotides along a DNA sequence.

Given a DNA sequence **D** (**Eq. 1**), the SC-PseDNC-General feature vector of **D** is defined:

$$\mathbf{D} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{16} & d_{16+1} & \cdots & d_{16+\lambda} & d_{16+\lambda+1} & \cdots & d_{16+\lambda\Lambda} \end{bmatrix}^{\mathbf{T}} \tag{26}$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda\Lambda}\theta_j} & (1 \le k \le 16) \\ \dfrac{w\theta_{k-16}}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda\Lambda}\theta_j} & (17 \le k \le 16+\lambda\Lambda) \end{cases} \tag{27}$$

where f_k（k=1, 2, ⋯, 16) is the normalized occurrence frequency of dinucleotide in the DNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a DNA sequence; *w* is the weight factor ranging from 0 to 1; Λ is the number of physicochemical indices (**Table 1**); θ_j (j = 1, 2, ⋯, λ) is called the *j*-tier correlation factor that reflects the sequence-order correlation between all the most contiguous dinucleotides along a DNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \mathrm{J}_{i,i+1}^{1} \\ \theta_2 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \mathrm{J}_{i,i+1}^{2} \\ \cdots\cdots \\ \theta_\Lambda = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \mathrm{J}_{i,i+1}^{\Lambda} & \lambda < (L-2) \\ \cdots\cdots \\ \theta_{\lambda\Lambda-1} = \dfrac{1}{L\text{-}\lambda\text{-}2}\sum_{i=1}^{L-\lambda-2} \mathrm{J}_{i,i+\lambda}^{\Lambda-1} \\ \theta_{\lambda\Lambda} = \dfrac{1}{L\text{-}\lambda\text{-}2}\sum_{i=1}^{L-\lambda-2} \mathrm{J}_{i,i+\lambda}^{\Lambda} \end{cases} \tag{28}$$

The correlation function is given by

$$\mathrm{J}_{i,i+m}^{u} = P_u(\mathrm{R}_i\mathrm{R}_{i+1}) \cdot P_u(\mathrm{R}_{i+m}\mathrm{R}_{i+\mathrm{m}+1}) \quad (u = 1,2,\cdots,\Lambda;\ m=1,2,\cdots,\lambda;\ i=1,2,\cdots,L\text{-}m\text{-}1) \tag{29}$$

where $P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_u(\mathrm{R}_{i+m}\mathrm{R}_{i+m+1})$) represents the numerical value of the u-th ($u = 1,\ 2,\ \cdots,\ \mu$) physiochemical index for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ ($\mathrm{R}_{i+m}\mathrm{R}_{i+\mathrm{m}+1}$) at position i (i+m).

1.3.6 General series correlation pseudo trinucleotide composition (SC-PseTNC-General)

SC-PseTNC-General (11) is a variant of PC-PseTNC-General, which differs in the equations of calculating the correlation factors reflecting the sequence-order correlation between all the most contiguous dinucleotides along a DNA sequence.

Given a DNA sequence **D** (**Eq. 1**), the SC-PseTNC-General feature vector of **D** is defined:

$$\mathbf{D} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{64} & d_{64+1} & \cdots & d_{64+\lambda} & d_{64+\lambda+1} & \cdots & d_{64+\lambda\Lambda} \end{bmatrix}^{\mathbf{T}} \tag{30}$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{64} f_i + w\sum_{j=1}^{\lambda\Lambda} \theta_j} & (1 \le k \le 64) \\ \dfrac{w\theta_{k-64}}{\sum_{i=1}^{64} f_i + w\sum_{j=1}^{\lambda\Lambda} \theta_j} & (64+1 \le k \le 64+\lambda\Lambda) \end{cases} \tag{31}$$

where f_k (k=1, 2, ⋯, 64) is the normalized occurrence frequency of trinucleotide in the DNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a DNA sequence; w is the weight factor ranging from 0 to 1; Λ is the number of physicochemical indices (**Table 2**); θ_j (j = 1, 2, ⋯, λ) is called the j-tier correlation factor reflecting the sequence-order correlation between all the most contiguous trinucleotides along a DNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4} \mathrm{J}_{i,i+1}^{1} \\ \theta_2 = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4} \mathrm{J}_{i,i+1}^{2} \\ \cdots\cdots \\ \theta_\Lambda = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4} \mathrm{J}_{i,i+1}^{\Lambda} \qquad \lambda < (L-3) \\ \cdots\cdots \\ \theta_{\lambda\Lambda-1} = \dfrac{1}{L\text{-}\lambda\text{-}3}\sum_{i=1}^{L-\lambda-3} \mathrm{J}_{i,i+\lambda}^{\Lambda-1} \\ \theta_{\lambda\Lambda} = \dfrac{1}{L\text{-}\lambda\text{-}3}\sum_{i=1}^{L-\lambda-3} \mathrm{J}_{i,i+\lambda}^{\Lambda} \end{cases} \tag{32}$$

The correlation function is given by

$$\begin{cases} \mathrm{J}_{i,i+m}^{u} = P_u(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}) \cdot P_u(\mathrm{R}_{i+m}\mathrm{R}_{i+m+1}\mathrm{R}_{i+m+2}) \\ u = 1, 2, \cdots, \Lambda;\ m = 1, 2, \cdots, \lambda;\ i = 1, 2, \cdots, L\text{-}m\text{-}2 \end{cases} \tag{33}$$

where $P_u(\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2})$ ($P_u(\mathrm{R}_{i+m}\mathrm{R}_{i+m+1}\mathrm{R}_{i+m+2})$) represents the numerical value of the *u*-th ($u = 1,\ 2,\ \cdots,\ \mu$) physiochemical index for the tri-nucleotide $\mathrm{R}_i\mathrm{R}_{i+1}\mathrm{R}_{i+2}$ ($\mathrm{R}_{i+m}\mathrm{R}_{i+m+1}\mathrm{R}_{i+m+2}$) at position *i* (*i*+*m*).

2. RNA

2.1 Ribonucleic acid composition

2.1.1 Basic kmer (Kmer)

Basic kmer (12) is the simplest approach to represent the RNAs, in which the RNA sequences are represented as the occurrence frequencies of *k* neighboring nucleic acids.

2.2 Autocorrelation

2.2.1 Dinucleotide-based auto covariance (DAC)

Suppose an RNA sequence **R** with *L* nucleic acid residues; i.e.

$$\mathrm{R} = \mathrm{R}_1\mathrm{R}_2\mathrm{R}_3\mathrm{R}_4\mathrm{R}_5\mathrm{R}_6\mathrm{R}_7\cdots\mathrm{R}_L \tag{34}$$

where R_1 represents the nucleic acid residue at the sequence position 1, R_2 the nucleic acid residue at position 2, and so forth.

The DAC (4-6) measures the correlation of the same physicochemical index between two dinucleotides separated by a distance of *lag* along the sequence, which can be calculated as:

$$\mathrm{DAC}(u,lag)=\sum_{i=1}^{L-lag-1}(P_u(\mathrm{R}_i\mathrm{R}_{i+1})-\overline{P}_u)(P_u(\mathrm{R}_{i+lag}\mathrm{R}_{i+lag+1})-\overline{P}_u)/(L-lag-1) \quad (35)$$

where u is a physicochemical index; L is the length of the RNA sequence, $P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_u(\mathrm{R}_{i+lag}\mathrm{R}_{i+lag+1})$) means the numerical value of the physicochemical index u for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ ($\mathrm{R}_{i+lag}\mathrm{R}_{i+lag+1}$) at position i ($i+lag$), $\overline{P}_u$ is the average value for physicochemical index u along the whole sequence:

$$\overline{P_u}=\sum_{j=1}^{L-1}P_u(\mathrm{R}_j\mathrm{R}_{j+1})/(L-1) \quad (36)$$

In such a way, the length of DAC feature vector is $N*$LAG, where N is the number of physicochemical indices (**Table 4**), which are extracted from (6,7), and LAG is the maximum of lag (lag = 1, 2, … , LAG).

2.2.2 Dinucleotide-based cross covariance (DCC)

Given an RNA sequence **R** (**Eq. 34**), the DCC (4,6) approach measures the correlation of two different physicochemical indices between two dinucleotides separated by lag nucleic acids along the sequence, which can be calculated by:

$$\mathrm{DCC}(u_1,u_2,lag)=\sum_{i=1}^{L-lag-1}(P_{u_1}(R_iR_{i+1})-\overline{P}_{u_1})(P_{u_2}(R_{i+lag}R_{i+lag+1})-\overline{P}_{u_2})/(L-lag-1) \quad (37)$$

where u_1, u_2 are two different physicochemical indices, L is the length of the RNA sequence, $P_{u_1}(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_{u_2}(\mathrm{R}_i\mathrm{R}_{i+1})$) is the numerical value of the physicochemical index u_1 (u_2) for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ at position i, $\overline{P}_{u_1}$ ($\overline{P}_{u_2}$) is the average value for physicochemical index value u_1 (u_2) along the whole sequence:

$$\overline{P_u}=\sum_{j=1}^{L-1}P_u(\mathrm{R}_j\mathrm{R}_{j+1})/(L-1) \quad (38)$$

In such a way, the length of the DCC feature vector is $N*(N-1)*$LAG, where N is the number of physicochemical indices (**Table 4**) and LAG is the maximum of lag (lag=1, 2, …, LAG).

2.2.3 Dinucleotide-based auto-cross covariance (DACC)

DACC (4,6) is a combination of DAC and DCC. Therefore, the length of the DACC feature vector is $N*N*$LAG, where N is the number of physicochemical indices (**Table 4**) and LAG is the maximum of lag (lag = 1, 2, …, LAG).

2.3 Pseudo ribonucleic acid composition

2.3.1 General parallel correlation pseudo dinucleotide composition (PC-PseDNC-General)

In PC-PseDNC-General (6) approach, the users cannot only select the 22 built-in physiochemical indices (**Table 4**), but also can upload their own indices to generate the PC-PseDNC-General feature vector.

Given an RNA sequence **R** (**Eq. 34**), the PC-PseDNC-General feature vector of **R** is defined:

$$\mathbf{R} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{16} & d_{16+1} & \cdots & d_{16+\lambda} \end{bmatrix}^{\mathbf{T}} \tag{39}$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda} \theta_j} & (1 \le k \le 16) \\ \dfrac{w\theta_{k-16}}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda} \theta_j} & (16+1 \le k \le 16+\lambda) \end{cases} \tag{40}$$

where f_k（k=1,2,⋯,16) is the normalized occurrence frequency of dinucleotide in the RNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a RNA sequence; w is the weight factor ranging from 0 to 1; θ_j (j=1, 2, ⋯, λ) is called the j-tier correlation factor reflecting the sequence-order correlation between all the i-th most contiguous dinucleotides along an RNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2} \Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+1}\mathrm{R}_{i+2}) \\ \theta_2 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+2}\mathrm{R}_{i+3}) \\ \theta_3 = \dfrac{1}{L\text{-}4}\sum_{i=1}^{L-4} \Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+3}\mathrm{R}_{i+4}) \qquad (\lambda < L) \\ \cdots\cdots \\ \theta_\lambda = \dfrac{1}{L\text{-}1\text{-}\lambda}\sum_{i=1}^{L-1-\lambda} \Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_{i+\lambda}\mathrm{R}_{i+\lambda+1}) \end{cases} \tag{41}$$

where the correlation function is given by

$$\Theta(\mathrm{R}_i\mathrm{R}_{i+1}, \mathrm{R}_j\mathrm{R}_{j+1}) = \frac{1}{\mu}\sum_{u=1}^{\mu} [P_u(\mathrm{R}_i\mathrm{R}_{i+1}) - P_u(\mathrm{R}_j\mathrm{R}_{j+1})]^2 \tag{42}$$

where μ is the number of physicochemical indices considered that are listed in the **Table 4**; $P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_u(\mathrm{R}_j\mathrm{R}_{j+1})$) represents the numerical value of the u-th ($u = 1,2,\cdots,\mu$) physicochemical index for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$($\mathrm{R}_j\mathrm{R}_{j+1}$) at position i (j).

2.3.2 General series correlation pseudo dinucleotide composition (SC-PseDNC-General)

SC-PseDNC-General (6) is a variant of PC-PseDNC-General, which differs in the equations of calculating the correlation factors reflecting the sequence-order correlation between all the most contiguous dinucleotides along an RNA sequence.

Given an RNA sequence **R** (**Eq. 34**), the SC-PseDNC-General feature vector of **R** is defined:

$$\mathbf{R} = \begin{bmatrix} d_1 & d_2 & \cdots & d_{16} & d_{16+1} & \cdots & d_{16+\lambda} & d_{16+\lambda+1} & \cdots & d_{16+\lambda\Lambda} \end{bmatrix}^{\mathbf{T}} \tag{43}$$

where

$$d_k = \begin{cases} \dfrac{f_k}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda\Lambda} \theta_j} & (1 \le k \le 16) \\ \dfrac{w\theta_{k-16}}{\sum_{i=1}^{16} f_i + w\sum_{j=1}^{\lambda\Lambda} \theta_j} & (16+1 \le k \le 16+\lambda\Lambda) \end{cases} \tag{44}$$

where f_k（k=1, 2, ⋯, 16) is the normalized occurrence frequency of dinucleotides in the RNA sequence; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along an RNA sequence; w is the weight factor ranging from 0 to 1; Λ is the number of physicochemical indices (**Table 4**); θ_j (j = 1, 2, ⋯, λ) is called the j-tier correlation factor reflecting the sequence-order correlation between all the j-th most contiguous dinucleotides along an RNA sequence, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \mathrm{J}_{i,i+1}^{1} \\ \theta_2 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \mathrm{J}_{i,i+1}^{2} \\ \cdots\cdots \\ \theta_\Lambda = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3} \mathrm{J}_{i,i+1}^{\Lambda} & \lambda < (L-2) \\ \cdots\cdots \\ \theta_{\lambda\Lambda-1} = \dfrac{1}{L\text{-}\lambda\text{-}2}\sum_{i=1}^{L-\lambda-2} \mathrm{J}_{i,i+\lambda}^{\Lambda-1} \\ \theta_{\lambda\Lambda} = \dfrac{1}{L\text{-}\lambda\text{-}2}\sum_{i=1}^{L-\lambda-2} \mathrm{J}_{i,i+\lambda}^{\Lambda} \end{cases} \tag{45}$$

The correlation function is given by

$$\begin{cases} \mathrm{J}_{i,i+m}^{u} = P_u(\mathrm{R}_i\mathrm{R}_{i+1}) \cdot P_u(\mathrm{R}_{i+m}\mathrm{R}_{i+m+1}) \\ u = 1, 2, \cdots, \Lambda;\ m = 1, 2, \cdots, \lambda;\ i = 1, 2, \cdots, L\text{-}\lambda\text{-}2 \end{cases} \tag{46}$$

$P_u(\mathrm{R}_i\mathrm{R}_{i+1})$ ($P_u(\mathrm{R}_{i+m}\mathrm{R}_{i+m+1})$) represents the numerical value of the u-th ($u = 1, 2, \cdots, \mu$) physiochemical index for the dinucleotide $\mathrm{R}_i\mathrm{R}_{i+1}$ ($\mathrm{R}_{i+m}\mathrm{R}_{i+m+1}$) at position i (i+m).

3. Protein

3.1 Amino acid composition

3.1.1 Basic kmer (Kmer)

Basic kmer (13) is the simplest approach to represent the proteins, in which the protein sequences are represented as the occurrence frequencies of *k* neighboring amino acids.

3.2 Autocorrelation

3.2.1 Auto covariance (AC)

Suppose a protein sequence **P** with *L* amino acid residues; i.e.

$$\mathrm{P} = \mathrm{R}_1\mathrm{R}_2\mathrm{R}_3\mathrm{R}_4\mathrm{R}_5\mathrm{R}_6\mathrm{R}_7\cdots\mathrm{R}_L \tag{47}$$

where R_1 represents the amino acid residue at the sequence position 1, R_2 the amino acid residue at position 2 and so forth.

The AC (4,5,14) approach measures the correlation of the same property between two residues separated by a distance of *lag* along the sequence, which can be calculated as:

$$\mathrm{AC}(i, lag) = \sum_{i=1}^{L-lag} (P_u(\mathrm{R}_i) - \overline{P}_u)(P_u(\mathrm{R}_{i+lag}) - \overline{P}_u) / (L - lag) \tag{48}$$

where *u* is a physicochemical index, *L* is the length of the protein sequence, $P_u(\mathrm{R}_i)$ means the numerical value of the physicochemical index *u* for the amino acid R_i at position *i*, $\overline{P}_u$ is the average value for physicochemical index *u* along the whole sequence:

$$\overline{P_u} = \sum_{j=1}^{L} P_u(\mathrm{R}_j) / L \tag{49}$$

In such a way, the length of AC feature vector is $N*\mathrm{LAG}$, where *N* is the number of physicochemical indices (**Table 5**) extracted from AAindex (15); LG is the maximum of *lag* (*lag*=1,2,...,LG).
For more information of this approach, please refer to (4,5).

3.2.2 Cross covariance (CC)

Given a protein sequence **P** (**Eq.47**), the CC (4,5,14) approach measures the correlation of two different properties between two residues separated by a distance of *lag* along the sequence, which can be calculated by:

$$\mathrm{CC}(u_1, u_2, lag) = \sum_{i=1}^{L-lag} (P_{u_1}(R_i) - \overline{P}_{u_1})(P_{u_2}(R_{i+lag}) - \overline{P}_{u_2}) / (L - lag) \tag{50}$$

where u_1, u_2 are two different physicochemical indices, *L* is the length of the protein sequence, $P_{u_1}(\mathrm{R}_i)$ ($P_{u_2}(\mathrm{R}_{i+lag})$) is the numerical value of the physicochemical index u_1 (u_2) for the amino acid R_i (R_{i+lag}) at position *i* (*i*+*lag*), $\overline{P}_{u_1}$ ($\overline{P}_{u_2}$) is the average value for physicochemical index value u_1 (u_2) along the whole sequence:

$$\overline{P_u} = \sum_{j=1}^{L} P_u(\mathrm{R}_j) / L \tag{51}$$

In such a way, the length of the CC feature vector is *N**(*N*-1)*LAG, where *N* is the number of physicochemical indices (**Table 5**) and LAG is the maximum of *lag* (*lag*=1, 2, …, LAG).

For more information of this approach, please refer to (4,5).

3.2.3 Auto-cross covariance (ACC)

ACC (4,5,14) is a combination of AC and CC. Therefore, the length of the ACC feature vector is *N***N**LAG, where *N* is the number of physicochemical indices (**Table 5**) and LAG is the maximum of *lag* (*lag* = 1, 2, …, LAG).

3.3 Pseudo amino acid composition

3.3.1 Parallel correlation pseudo amino acid composition (PC-PseAAC)

PC-PseAAC (16) is an approach incorporating the contiguous local sequence-order information and the global sequence-order information into the feature vector of the protein sequence.

Given a Protein sequence **P** (**Eq.47**), the PC-PseAAC feature vector of **P** is defined:

$$\mathbf{P} = \begin{bmatrix} x_1 & x_2 & \cdots & x_{20} & x_{20+1} & \cdots & x_{20+\lambda} \end{bmatrix}^{\mathbf{T}} \tag{52}$$

where

$$x_u = \begin{cases} \dfrac{f_u}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{\lambda} \theta_j} & (1 \le u \le 20) \\ \dfrac{w\theta_{u-20}}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{\lambda} \theta_j} & (20+1 \le u \le 20+\lambda) \end{cases} \tag{53}$$

where f_i (i=1,2,⋯,20) is the normalized occurrence frequency of the 20 amino acids in the protein **P**; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a protein sequence; w is the weight factor ranging from 0 to 1; θ_j (j=1,2,⋯,λ) is called the j-tier correlation factor reflecting the sequence-order correlation between all the j-th most contiguous residues along a protein chain, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1}\Theta(\mathrm{R}_i,\mathrm{R}_{i+1}) \\ \theta_2 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2}\Theta(\mathrm{R}_i,\mathrm{R}_{i+2}) \\ \theta_3 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3}\Theta(\mathrm{R}_i,\mathrm{R}_{i+3}) \qquad (\lambda < L) \\ \cdots\cdots \\ \theta_\lambda = \dfrac{1}{L\text{-}\lambda}\sum_{i=1}^{L-\lambda}\Theta(\mathrm{R}_i,\mathrm{R}_{i+\lambda}) \end{cases} \tag{54}$$

where the correlation function is given by

$$\Theta(\mathrm{R}_i,\mathrm{R}_j)=\frac{1}{3}\left\{\left[H_1(\mathrm{R}_j)-H_1(\mathrm{R}_i)\right]^2+\left[H_2(\mathrm{R}_j)-H_2(\mathrm{R}_i)\right]^2+\left[M(\mathrm{R}_j)-M(\mathrm{R}_i)\right]^2\right\} \tag{55}$$

where $H_1(\mathrm{R}_i)$, $H_2(\mathrm{R}_i)$, and $M(\mathrm{R}_i)$ are, respectively, the hydrophobicity value, hydrophilicity value, and side-chain mass (**Table 6**) of the amino acid R_i; Note that before substituting the values of hydrophobicity, hydrophilicity, and side-chain mass into **Eq. 55**, they are all subjected to a standard conversion as described by the following equation:

$$\begin{cases} H_1(i) = \dfrac{H_1^0(i) - \sum_{i=1}^{20}\frac{H_1^0(i)}{20}}{\sqrt{\frac{\sum_{i=1}^{20}\left[H_1^0(i) - \sum_{i=1}^{20}\frac{H_1^0(i)}{20}\right]^2}{20}}} \\ H_2(i) = \dfrac{H_2^0(i) - \sum_{i=1}^{20}\frac{H_2^0(i)}{20}}{\sqrt{\frac{\sum_{i=1}^{20}\left[H_2^0(i) - \sum_{i=1}^{20}\frac{H_2^0(i)}{20}\right]^2}{20}}} \\ M(i) = \dfrac{M^0(i) - \sum_{i=1}^{20}\frac{M^0(i)}{20}}{\sqrt{\frac{\sum_{i=1}^{20}\left[M^0(i) - \sum_{i=1}^{20}\frac{M^0(i)}{20}\right]^2}{20}}} \end{cases} \tag{56}$$

where $H_1^0(i)$ is the original hydrophobicity value of the *i*-th amino acid; $H_2^0(i)$ the corresponding original hydrophilicity value; $M^0(i)$ the mass of the *i*-th amino acid side chain.

3.3.2 Series correlation pseudo amino acid composition (SC-PseAAC)

SC-PseAAC (17) is a variant of PC-PseAAC. Given a protein sequence **P** (**Eq.47**), the SC-PseAAC feature vector of **P** is defined:

$$\mathbf{P} = \begin{bmatrix} p_1 & p_2 & \cdots & p_{20} & p_{20+1} & \cdots & p_{20+\lambda} & p_{20+\lambda+1} & \cdots & p_{20+2\lambda} \end{bmatrix}^{\mathbf{T}} \tag{57}$$

where

$$p_u = \begin{cases} \dfrac{f_u}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{2\lambda} \tau_j} & (1 \le u \le 20) \\ \dfrac{w\tau_{u-20}}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{2\lambda} \tau_j} & (20+1 \le u \le 20+2\lambda) \end{cases} \quad (58)$$

where f_i *(i* = 1, 2,... , 20*)* is the normalized occurrence frequency of the 20 native amino acids in the protein **P**; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a protein sequence; *w* is the weight factor ranging from 0 to 1; τ_j the *j* -tier sequence-correlation factor that reflects the sequence-order correlation between all the most contiguous residues along a protein sequence, which is defined:

$$\begin{cases} \tau_1 = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1} H_{i,i+1}^1 \\ \tau_2 = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1} H_{i,i+1}^2 \\ \tau_3 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2} H_{i,i+2}^1 \\ \tau_4 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2} H_{i,i+2}^2 \qquad \lambda < L-1 \\ \cdots\cdots \\ \tau_{2\lambda-1} = \dfrac{1}{L\text{-}\lambda}\sum_{i=1}^{L-\lambda} H_{i,i+\lambda}^1 \\ \tau_{2\lambda} = \dfrac{1}{L\text{-}\lambda}\sum_{i=1}^{L-\lambda} H_{i,i+\lambda}^2 \end{cases} \quad (59)$$

where $H_{i,\mathrm{j}}^1$ and $H_{i,\mathrm{j}}^2$ are the hydrophobicity and hydrophilicity correlation functions given by

$$\begin{cases} H_{i,j}^1 = h^1(\mathrm{R}_i) \cdot h^1(\mathrm{R}_j) \\ H_{i,j}^2 = h^2(\mathrm{R}_i) \cdot h^2(\mathrm{R}_j) \end{cases} \quad (60)$$

where $h^1(\mathrm{R}_i)$ and $h^2(\mathrm{R}_i)$ are, respectively, the hydrophobicity and hydrophilicity values(**Table 7**) for the *i*-th (*i* = 1, 2, . . . ,*L*) amino acid in **Eq.47**, and the dot (•) means the multiplication sign.

Note that before substituting the values of hydrophobicity and hydrophilicity into **Eq.60**, they are all subjected to a standard conversion as described by the following equation:

$$\begin{cases} h^1(\mathrm{R}_i) = \dfrac{h_0^1(\mathrm{R}_i) - \sum_{k=1}^{20} \dfrac{h_0^1(\mathbb{R}_k)}{20}}{\sqrt{\dfrac{\sum_{u=1}^{20}\left[h_0^1(\mathbb{R}_u) - \sum_{k=1}^{20} \dfrac{h_0^1(\mathbb{R}_k)}{20}\right]^2}{20}}} \\ h^2(\mathrm{R}_i) = \dfrac{h_0^2(\mathrm{R}_i) - \sum_{k=1}^{20} \dfrac{h_0^2(\mathbb{R}_k)}{20}}{\sqrt{\dfrac{\sum_{u=1}^{20}\left[h_0^2(\mathbb{R}_u) - \sum_{k=1}^{20} \dfrac{h_0^2(\mathbb{R}_k)}{20}\right]^2}{20}}} \end{cases} \quad (61)$$

where we use the $\mathbb{R}_i$ (i = 1, 2, . . . , 20) to represent the 20 native amino acids. The symbols h_0^1 and h_0^2 represent the original hydrophobicity and hydrophilicity values of the amino acid in the brackets right after the symbols.

For more information of the SC-PseAAC, please refer to (17).

3.3.3 General parallel correlation pseudo amino acid composition (PC-PseAAC-General)

The PC-PseAAC-General approach (14) cannot only incorporate comprehensive built-in indices (**Table 5**) extracted from AAindex (15), but also allow the users to upload their own indices to generate the PC-PseAAC-General feature vector.

Given a protein sequence **P** (**Eq.47**), the PC-PseAAC-General feature vector of **P** is defined:

$$\mathbf{P} = \begin{bmatrix} x_1 & x_2 & \cdots & x_{20} & x_{20+1} & \cdots & x_{20+\lambda} \end{bmatrix}^{\mathbf{T}} \quad (62)$$

where

$$x_u = \begin{cases} \dfrac{f_u}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{\lambda} \theta_j} & (1 \le u \le 20) \\ \dfrac{w\theta_{u-20}}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{\lambda} \theta_j} & (20+1 \le u \le 20+\lambda) \end{cases} \quad (63)$$

where f_i (i=1,2,···,20) is the normalized occurrence frequency of the 20 amino acids in the protein **P**; the parameter λ is an integer, representing the highest counted rank (or tier) of the correlation along a protein sequence; w is the weight factor ranging from 0 to 1; θ_j (j=1,2,···,λ) is called the j-tier correlation factor reflecting the sequence-order correlation between all the j-th most contiguous residues along a protein chain, which is defined:

$$\begin{cases} \theta_1 = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1}\Theta(\mathrm{R}_i, \mathrm{R}_{i+1}) \\ \theta_2 = \dfrac{1}{L\text{-}2}\sum_{i=1}^{L-2}\Theta(\mathrm{R}_i, \mathrm{R}_{i+2}) \\ \theta_3 = \dfrac{1}{L\text{-}3}\sum_{i=1}^{L-3}\Theta(\mathrm{R}_i, \mathrm{R}_{i+3}) \quad (\lambda < L) \\ \cdots\cdots \\ \theta_\lambda = \dfrac{1}{L\text{-}\lambda}\sum_{i=1}^{L-\lambda}\Theta(\mathrm{R}_i, \mathrm{R}_{i+\lambda}) \end{cases} \tag{64}$$

where the correlation function is given by

$$\Theta(\mathrm{R}_i, \mathrm{R}_j) = \frac{1}{\mu}\sum_{u=1}^{\mu}[H_u(\mathrm{R}_i) - H_u(\mathrm{R}_j)]^2 \tag{65}$$

where μ is the number of physicochemical indices considered that listed in the **Table 5**; $H_u(\mathrm{R}_i)$ is the *u*-th physicochemical index value of the amino acid R_i; $H_u(\mathrm{R}_j)$, the *u*-th physicochemical index value for the amino acid R_j. Note that before substituting the physicochemical indices values into **Eq.65**, they are all subjected to a standard conversion as described by the following equation:

$$H_u(i) = \frac{H_u^0(i) - \sum_{i=1}^{20}\frac{H_u^0(i)}{20}}{\sqrt{\frac{\sum_{i=1}^{20}\left[H_u^0(i) - \sum_{i=1}^{20}\frac{H_u^0(i)}{20}\right]^2}{20}}} \tag{66}$$

where $H_u^0(i)$ is the *u*-th original physicochemical value of the *i*-th amino acid.

3.3.4 General series correlation pseudo amino acid composition (SC-PseAAC-General)

The SC-PseAAC-General approach (14) cannot only incorporate comprehensive built-in indices (**Table 5**) extracted from AAindex (15), but also allow the users to upload their own indices to generate the SC-PseAAC-General feature vector.

Given a protein sequence **P** (**Eq.47**), the SC-PseAAC-General feature vector of **P** is defined:

$$\mathbf{P} = \begin{bmatrix} p_1 & p_2 & \cdots & p_{20} & p_{20+1} & \cdots & p_{20+\lambda} & p_{20+\lambda+1} & \cdots & p_{20+\lambda\Lambda} \end{bmatrix}^{\mathbf{T}} \tag{67}$$

where

$$p_u = \begin{cases} \dfrac{f_u}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{\lambda\Lambda}\tau_j} & (1 \le u \le 20) \\ \dfrac{w\tau_{u-20}}{\sum_{i=1}^{20} f_i + w\sum_{j=1}^{\lambda\Lambda}\tau_j} & (20+1 \le u \le 20+\lambda\Lambda) \end{cases} \tag{68}$$

where f_i (i = 1, 2,... , 20) is the normalized occurrence frequency of the 20 native amino acids in the protein **P**, the parameter λ is an integer, representing the highest

counted rank (or tier) of the correlation along a protein sequence; *w* is the weight factor ranging from 0 to 1; Λ is the number of physicochemical indices (**Table 5**); τ_j the *j* -tier sequence-correlation factor reflecting the sequence-order correlation between all the most contiguous residues along a protein sequence, which is defined:

$$\begin{cases} \tau_1 = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1} H_{i,i+1}^{1} \\ \tau_2 = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1} H_{i,i+1}^{2} \\ \cdots\cdots \\ \tau_\Lambda = \dfrac{1}{L\text{-}1}\sum_{i=1}^{L-1} H_{i,i+1}^{\Lambda} \qquad \lambda < (L-1) \\ \cdots\cdots \\ \tau_{\lambda\Lambda-1} = \dfrac{1}{L\text{-}\lambda}\sum_{i=1}^{L-\lambda} H_{i,i+\lambda}^{\Lambda-1} \\ \tau_{\lambda\Lambda} = \dfrac{1}{L\text{-}\lambda}\sum_{i=1}^{L-\lambda} H_{i,i+\lambda}^{\Lambda} \end{cases} \tag{69}$$

where $H_{i,\mathrm{i+m}}^{\xi}$ is the correlation function given by

$$\begin{cases} H_{i,i+m}^{\zeta} = h^{\zeta}(\mathrm{R}_i)\cdot h^{\zeta}(\mathrm{R}_{i+m}) \\ \zeta = 1,2,\cdots,\Lambda;\ m=1,2,\cdots,\lambda;\ i=1,2,\cdots,L-m \end{cases} \tag{70}$$

where $h^{\zeta}(\mathrm{R}_i)$ is the ζ -th physicochemical value for the *i*-th (*i* = 1, 2, . . . ,*L*) amino acid in **Eq.47**, and the dot (•) means the multiplication sign.

Note that before substituting the physicochemical values into **Eq.70**, they are all subjected to a standard conversion as described by the following equation:

$$h^{\zeta}(\mathrm{R}_i) = \frac{h_0^{\zeta}(\mathrm{R}_i) - \sum_{k=1}^{20}\frac{h_0^{\zeta}(\mathbb{R}_k)}{20}}{\sqrt{\frac{\sum_{u=1}^{20}\left[h_0^{\zeta}(\mathbb{R}_u) - \sum_{k=1}^{20}\frac{h_0^{\zeta}(\mathbb{R}_k)}{20}\right]^2}{20}}} \tag{71}$$

where we use the $\mathbb{R}_i$ (*i* = 1, 2, . . . , 20) to represent the 20 native amino acids. The symbols h_0^{ζ} represent the ζ -th original physicochemical value of the amino acid in the brackets right after the symbols.

Table 1. The names of the 148 physicochemical indices for dinucleotides (DNA).

The values of 148 physicochemical indices can be found here.

Base stacking	Protein induced deformability	B-DNA twist
Propeller twist	Duplex stability:(freeenergy)	Duplex tability(disruptenergy)
Protein DNA twist	Stabilising energy of Z-DNA	Aida_BA_transition
Breslauer_dS	Electron_interaction	Hartman_trans_free_energy
Lisser_BZ_transition	Polar_interaction	SantaLucia_dG
Sarai_flexibility	Stability	Stacking_energy
Sugimoto_dS	Watson-Crick_interaction	Twist
Shift	Slide	Rise
Twist stiffness	Tilt stiffness	Shift_rise
Twist_shift	Enthalpy1	Twist_twist
Shift2	Tilt3	Tilt1
Slide (DNA-protein complex)1	Tilt_shift	Twist_tilt
Roll_rise	Stacking energy	Stacking energy1
Propeller Twist	Roll11	Rise (DNA-protein complex)
Roll2	Roll3	Roll1
Slide_slide	Enthalpy	Shift_shift
Flexibility_slide	Minor Groove Distance	Rise (DNA-protein complex)1
Roll (DNA-protein complex)1	Entropy	Cytosine content
Major Groove Distance	Twist (DNA-protein complex)	Purine (AG) content
Tilt_slide	Major Groove Width	Major Groove Depth
Free energy6	Free energy7	Free energy4
Free energy3	Free energy1	Twist_roll
Flexibility_shift	Shift (DNA-protein complex)1	Thymine content
Tip	Keto (GT) content	Roll stiffness
Entropy1	Roll_slide	Slide (DNA-protein complex)
Twist2	Twist5	Twist4
Tilt (DNA-protein complex)1	Twist_slide	Minor Groove Depth
Persistance Length	Rise3	Shift stiffness
Slide3	Slide2	Slide1
Rise1	Rise stiffness	Mobility to bend towards minor groove
Dinucleotide GC Content	A-philicity	Wedge
DNA denaturation	Bending stiffness	Free energy5
Breslauer_dG	Breslauer_dH	Shift (DNA-protein complex)
Helix-Coil_transition	Ivanov_BA_transition	Slide_rise
SantaLucia_dH	SantaLucia_dS	Minor Groove Width
Sugimoto_dG	Sugimoto_dH	Twist1
Tilt	Roll	Twist7
Clash Strength	Roll_roll	Roll (DNA-protein complex)

Adenine content	Direction	Probability contacting nucleosome core
Roll_shift	Shift_slide	Shift1
Tilt4	Tilt2	Free energy8
Twist (DNA-protein complex)1	Tilt_rise	Free energy2
Stacking energy2	Stacking energy3	Rise_rise
Tilt_tilt	Roll4	Tilt_roll
Minor Groove Size	GC content	Inclination
Slide stiffness	Melting Temperature1	Twist3
Tilt (DNA-protein complex)	Guanine content	Twist6
Major Groove Size	Twist_rise	Rise2
Melting Temperature	Free energy	Mobility to bend towards major groove
Bend		

Table 2. The names of the 12 physicochemical indices for trinucleotides (DNA).

For more information of the indices listed in this table, please click here, their values can be found here.

Bendability (DNAse)	Bendability (consensus)	Trinucleotide GC Content
Consensus_roll	Consensus-Rigid	Dnase I
MW-Daltons	MW-kg	Nucleosome
Nucleosome positioning	Dnase I-Rigid	Nucleosome-Rigid

Table 3. The names of the 6 physicochemical indices for dinucleotides (DNA).

For more information of the indices listed in this table, please click here, their values can be found here.

Twist(DNA)	Tilt(DNA)	Roll(DNA)
Shift(DNA)	Slide(DNA)	Rise(DNA)

Table 4. The names of the 22 physicochemical indices for dinucleotides (RNA).

For more information of the indices listed in this table, please click here, their values can be found here.

Shift (RNA)	Hydrophilicity (RNA)
Hydrophilicity (RNA)	GC content
Purine (AG) content	Keto (GT) content
Adenine content	Guanine content
Cytosine content	Thymine content
Slide (RNA)	Rise (RNA)
Tilt (RNA)	Roll (RNA)
Twist (RNA)	Stacking energy (RNA)
Enthalpy (RNA)	Entropy (RNA)
Free energy (RNA)	Free energy (RNA)
Enthalpy (RNA)	Entropy (RNA)
