

Figure S1. Proportion of internal details within each detail type was similar across groups and memory conditions, as indicated by a null main effect of group ($F_{2,25} = .16, p = .85, \eta^2 = .01$) and condition ($F_{1,47,36.62} = .50, p = .55, \eta^2 = .02$) with no significant higher order interactions between group and detail type or group and condition (all p s > .15). HCs, healthy controls; PTSD, post-traumatic stress disorder.
