

Supplementary Data

SUPPLEMENTARY FIG. S1. Flow cytometry analysis of 7-AAD stained cells after treatment of human cord blood-derived mesenchymal stem cells (hCB-MSCs) with 0.2 μ M sphingosine-1-phosphate (SIP) or 2.5 μ g/mL LL-37 for 3 h. For positive control, hCB-MSCs treated with 1 mM H₂O₂ for 3 h were used. The percentage of 7-AAD-positive cells was shown in each FACS histogram.
