

The Anxiolytic and Antidepressant-like Effects of Testosterone and Estrogen in Gonadectomized Male Rats

Supplemental Information

Supplemental Methods and Materials

Mass Spectrometry

Brain tissue extract was redissolved in 10% acetonitrile aqueous solution with 0.1% formic acid (20 μ L/10 mg tissue). The above solution, 3.75 μ L, was injected to be separated by liquid chromatography with a NanoAquity nanoLC system (Waters, Milford, MA). Eluents were ionized by nano electrospray ionization in positive mode and detected online with a Xevo TQ-S Triple Quadrupole Mass Spectrometer (Waters, Milford, MA). A Symmetry C18 5 μ m 0.180 x 20 mm trap column and a HSS T3 1.8 μ m 0.075 x 150 mm analytical column (both by Waters, Milford, MA) in a vented configuration were used for separation. The LC gradient was formed from buffer A (0.1% formic acid in water) and buffer B (0.1% formic acid in acetonitrile). Sample solution was loaded on the trap column at 10 μ L/min for 0.5 min at 10% B. The gradient profile was: 10% B at run start, 95% B at 15 minutes, 10% B from 20-35 minutes at 0.4 μ L/min flow rate. The conditions for the nanoelectrospray source were: +3 kV capillary voltage, 30 V cone voltage, 50 V source offset, 70°C source temperature, and 0.20 bar spray gas. Two MRM transitions (testosterone: m/z 289/109 and testosterone-d3: m/z 292/109) were acquired at 3 ms dwell time and 30 V collision energy. Seven calibration standards were prepared containing 0.5 ng/mL of testosterone-d3 and a range of testosterone/testosterone-d3: 0.02, 0.1, 0.2, 1, 2, 10 & 20 ng/mL.

Samples and standards were run in triplicate. Chromatograms were acquired and the area under curve (AUC) was calculated for both testosterone and the IS, testosterone-d3. The concentration of testosterone in the unknown samples was calculated by comparing the AUC to the standard curve of the calibration standards under the same condition. Data were analyzed by two-way ANOVA, followed by post-hoc Bonferroni's multiple comparisons tests.
