

## SUPPLEMENTAL MATERIAL

**Figure S1. *Gi*Tom40 biotinylation by cytosolic BirA.** *Gi*Tom40 is biotinylated when co-expressed with cytBirA. BAP-tagged *Gi*Tom40 was detected by streptavidin conjugated with Alexa 488 (green). Cytosolic BirA was detected with anti-HA tag antibody (red). Nuclei were stained with DAPI (blue).

**Figure S2. Localization of N-terminally truncated *Gi*MOMP35 and full length GL50803\_9296.**

(A) When *Gi*MOMP35 was expressed without two predicted N-terminal transmembrane domains ( $\Delta$ *NGi*MOMP35) its mitochondrial localization was abolished and the protein was localized in the cytosol.  $\Delta$ *NGi*MOMP35 was detected by anti-HA tag antibody (green) and mitochondria were labeled by anti-GL50803\_9296 antibody (red), nuclei were stained with DAPI (blue). (B) During the protease protection assay the HSP from wild type *G. intestinalis* was solubilized in isotonic, hypotonic, NaCl-containing or Triton-containing buffer. The suspensions were treated either by pipetting or sonication and subjected to the treatment by proteinase K. The resulting samples were resolved on SDS-PAGE, transferred to membrane and probed for the matrix marker protein IscS, outer membrane protein Tom40 and GL50803\_9296. While Tom40 was sensitive to the protease in the isotonic buffer, both GL50803\_9296 and IscS remained protected by mitochondrial membranes. These data suggest the matrix localization of GL50803\_9296.

**Figure S3. The compiled lists of the most significant hits obtained from the purification**

**experiments of five mitochondrial proteins.** The results were divided into two sets derived either from the purification of the matrix or the outer membrane proteins. The results were colour-coded in (A): the proteins found in *Gi*Pam18- and *Gi*Tim44-specific datasets are shown in green, the proteins found in *Gi*Pam18- and *Gi*Hsp70-specific datasets are shown in red, the proteins found in *Gi*Tim44- and *Gi*Hsp70-specific datasets are shown in blue and the proteins common to all three datasets are shown in yellow. In (B), the proteins found in *Gi*Tom40- and *Gi*MOMP35-specific datasets are shown in violet. The novel mitochondrial proteins confirmed by episomal expression are shown with red

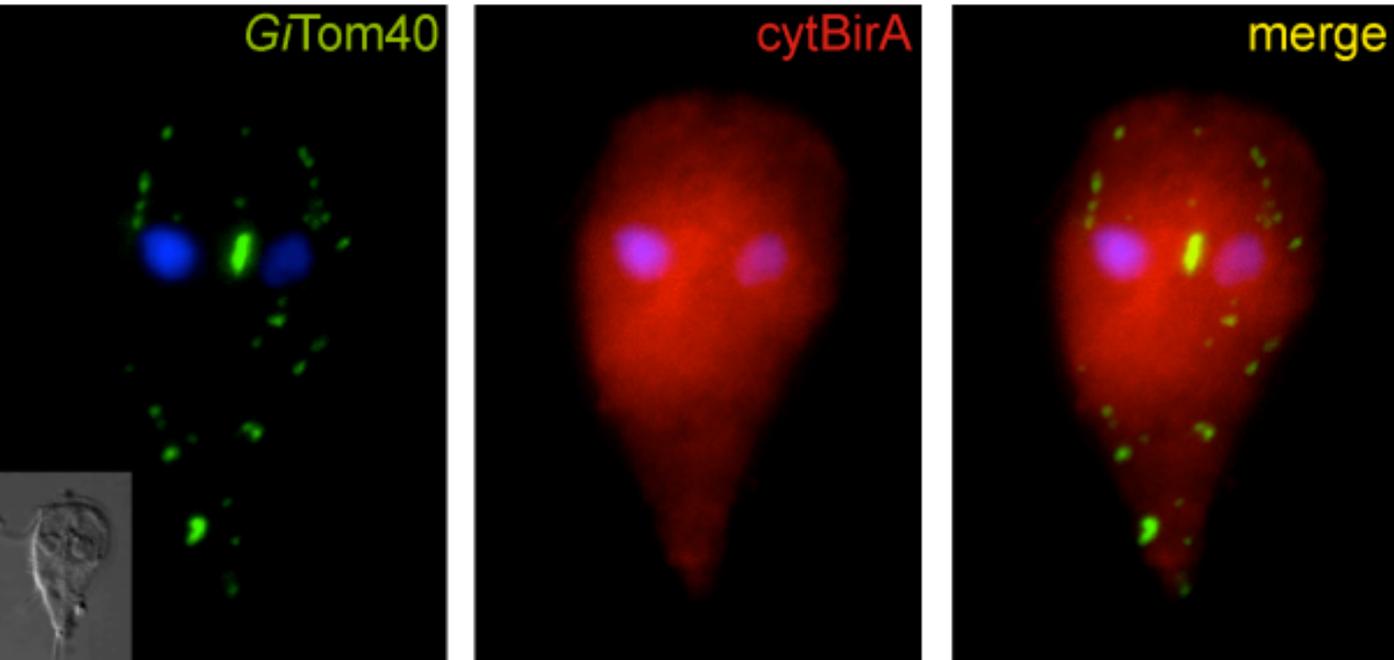

borders and the proteins whose episomal expression resulted in a different than mitochondrial localization are shown in grey. The proteins, the episomal expression of which induced a lethal phenotype, are labelled by a black cross.

**Table S1. Primers used in the study.**

**Table S2. The list of genes episomally expressed in *G. intestinalis*.**

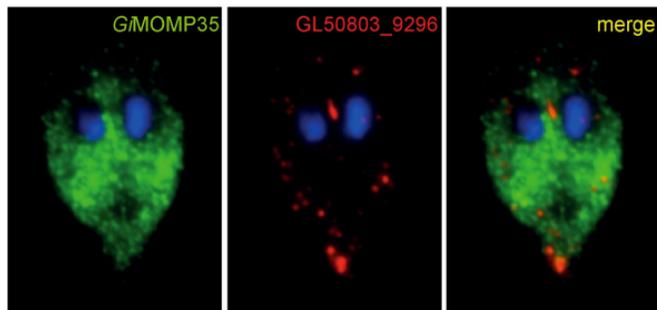

**Table S3. Distribution of the identified proteins in metamonads.**

The genome project of *T. vaginalis* and *S. salmonicida* were searched for the presence of the novel *G. intestinalis* mitochondrial proteins.
